

## 2016 Deepwater Exploration of the Marianas

# Viscous Volcanoes

Image captions/credits on Page 2.

# lesson plan

### Focus

Serpentine mud volcanoes

### Grade Level

6-8 (Earth Science)

### Focus Question

What are serpentine mud volcanoes and how are they different from magma volcanoes?

### Learning Objectives

- Students will describe mud volcanoes, contrast them with magma volcanoes, and explain how these structures, the Mariana Islands, and the Mariana Trench are related to the motion of tectonic plates.

### Materials

#### **For each serpentine mud volcano model:**

- Plastic tubing, approximately 1/4" outer diameter, 1/8" inside diameter
- 2-liter plastic soda bottle
- Fast-setting epoxy glue
- Air-cure modeling clay, approximately 500 ml
- Fine sand, table salt, or finely ground coffee
- Drill and drill bit to match outside diameter of plastic tubing

#### **For each sediment-derived mud volcano model:**

- 2-liter plastic soda bottle
- Cardboard or acrylic disk, diameter slightly smaller than soda bottle diameter
- Fine sand or clay
- Drill and drill bits, 3/8" and 1/2"

#### **For each magma volcano model:**

- Modeling materials, depending upon techniques chosen (see Learning Procedure, Step 1d and Step 4.

### Audio-Visual Materials

- (Optional) Interactive whiteboard

### Teaching Time

Two or three 45-minute class periods

## Seating Arrangement

Groups of two to four students

## Maximum Number of Students

30

## Key Words

Mariana Arc  
Serpentine  
Mud volcano  
Mariana Trench  
Magma volcano  
Tectonic plate

### Images from Page 1 top to bottom:

ROV *Deep Discoverer* (D2) will be used to conduct daily dives from 250 to 6,000 meters. Image courtesy of the NOAA Office of Ocean Exploration and Research. <http://oceanexplorer.noaa.gov/oceanos/explorations/ex1605/background/plan/media/d2.html>

NOAA Ship *Okeanos Explorer* uses telepresence technology to transmit data in real time to a shore-based hub where the video is then transmitted to a number of Exploration Command Centers located around the country as well as to any Internet-enabled device. Access to the video combined with a suite of Internet-based collaboration tools allow scientists on shore to join the operation in real-time, and allows the general public to follow the expedition online. ## Background Information

*NOTE: Explanations and procedures in this lesson are written at a level appropriate to professional educators. In presenting and discussing this material with students, educators may need to adapt the language and instructional approach to styles that are best suited to specific student groups.*

The Marina Trench is an oceanic trench in the western Pacific Ocean that is formed by the collision of two large pieces of the Earth's crust known as tectonic plates. These plates are portions of the Earth's outer crust (the lithosphere) about 5 km thick, as well as the upper 60 - 75 km of the underlying mantle. The plates move on a hot, flexible mantle layer called the asthenosphere, which is several hundred kilometers thick.

The Pacific Ocean Basin lies on top of the Pacific Plate. To the east, new crust is formed by magma rising from deep within the Earth. The magma erupts along boundaries between the Pacific Plate and the North American and South American Plates. The Pacific Plate slowly moves westward, away from the North American and South American Plates. Because the plates are moving apart, their junction is called a divergent plate boundary.

At the Mariana Trench, the west-moving Pacific Plate converges against the Phillipine Plate (this type of plate junction is called a convergent plate boundary). The Pacific Plate is forced beneath the Phillipine Plate, and as the sinking plate moves deeper into the mantle, fluids are released from the rock causing the overlying mantle to partially melt. The new magma (molten rock) rises and may erupt violently to form volcanoes, often forming arcs of islands along the convergent boundary. The Mariana Islands are the result of

Cross-section of the Mariana subduction zone, showing the relationship between the Trench, Forearc, Volcanic Arc, and Back-Arc. Image adapted from Hussong and Fryer, 1981.

<http://oceanexplorer.noaa.gov/oceanos/explorations/ex1605/background/geology/media/fig1-hires.jpg>

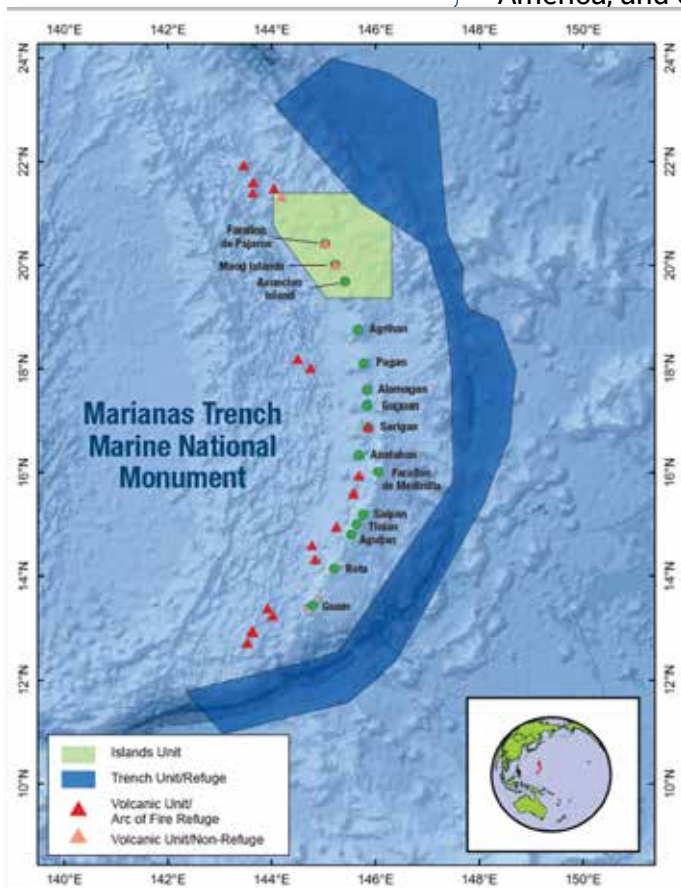

this volcanic activity. The subduction processes that produce volcanoes can also cause major earthquakes. The movement of the Pacific Ocean tectonic plate has been likened to a huge conveyor belt on which new crust is formed at the oceanic spreading ridges off the western coasts of North and South America, and older crust is recycled to the lower mantle at the

convergent plate boundaries of the western Pacific. The Mariana Trench includes the Challenger Deep, the deepest known area of Earth's ocean (10,916 meters; 35,814 feet deep).

In 2009, the Marianas Trench Marine National Monument was established to protect biological and geological resources associated with volcanoes, islands, and deepwater habitats in the vicinity of the Mariana Trench. These resources include subduction systems in the trench; submerged volcanoes; hydrothermal vents; coral reef, chemosynthetic, and hydrothermal ecosystems; and deep-sea coral and sponge communities.

NOAA's Ocean Explorer program has a long history of explorations in the vicinity of the Mariana Trench. In 2003, the Ocean Exploration Ring of Fire Expedition surveyed more than 50 volcanoes along the Mariana Arc, and discovered that ten of these had

active hydrothermal systems (visit <http://oceanexplorer.noaa.gov/explorations/03fire/welcome.html> for more information on these discoveries). The 2004 Submarine Ring of Fire Expedition focused specifically on hydrothermal systems of the Mariana Arc volcanoes, and found that these systems are

Management designations within the Marianas Trench Marine National Monument. The green points denote islands. Image courtesy of the Marianas Trench Marine National Monument.

<http://oceanexplorer.noaa.gov/oceanos/explorations/ex1605/background/mtmnm/media/map.html>

very different from those found along mid-ocean ridges (visit <http://oceanexplorer.noaa.gov/explorations/04fire/welcome.html> for more information). The 2006 Submarine Ring of Fire Expedition focused on interdisciplinary investigations of the hydrothermal and volcanic processes on the submarine volcanoes of the Mariana Arc. In 2007, 2012, and 2014, Ocean Explorer expeditions visited other areas of the Submarine Ring of Fire. In 2015, NOAA and other partners began a multi-year science effort named CAPSTONE (Campaign to Address Pacific monument Science, Technology, and Ocean Needs) focused on deepwater areas of U.S. marine protected areas in the central and western Pacific Ocean.

The 2016 Deepwater Exploration of the Marianas Expedition continues the CAPSTONE program, focusing specifically on deepwater habitats in and around the Marianas Trench Marine National Monument (MTMNM) and the Commonwealth of the Northern Mariana Islands (CNMI). The purpose of the expedition is to provide information about these unexplored and poorly known habitats. This information is essential to understanding and managing deepwater resources associated with Earth's deepest oceanic trench.

The Marianas Trench Marine National Monument is part of a larger region known as the Submarine Ring of Fire, named for the numerous volcanoes that result from the movements of tectonic plates in the region. While

the best-known volcanoes are those that involve eruptions of molten rock (magma volcanoes), the MTMNM also includes mud volcanoes. Mud volcanoes are found around the world, and are commonly produced when a viscous mixture of water and sediment (that we commonly call "mud") beneath the

Map of the all the volcanoes around the Pacific (red triangles) making up the Ring of Fire. Image courtesy of Submarine Ring of Fire 2014 - Ironman, NOAA/PMEL, NSF. <http://oceanexplorer.noaa.gov/oceanos/explorations/ex1605/background/history/media/fig1.html>

the best-known volcanoes are those that involve eruptions of molten rock (magma volcanoes), the MTMNM also includes mud volcanoes. Mud volcanoes are found around the world, and are commonly produced when a viscous mixture of water and sediment (that we commonly call "mud") beneath the

land or seafloor surface becomes pressurized and erupts to the surface to form a pool that often is surrounded by a cone similar to the cone we associate with magma volcanoes.

Mud volcanoes in the Mariana region, however, are formed by a different process. The mud volcanoes here form only in the zone between the trench and the active volcanic arc. This area is called the “forearc” region. Here, movement of tectonic plates brings mantle rocks into contact with seawater. When this happens, numerous chemical reactions occur between fluids driven off of the subducting Pacific Ocean plate and minerals in the mantle rock (a process called serpentinization, producing a new type of rock called serpentinite). Serpentine is less dense than the surrounding mantle rock, and it is very soft so is easily crushed. There are many faults in the forearc area and fluids from the subducting plate tend to find their way to sea floor springs along the fault planes. When earthquakes occur, the rocks on either side of a moving fault plane grind up the soft serpentinized rock, thus rising fluids mix with the ground-up rock to form serpentinite mud. When the serpentinite muds ooze out of the fault up to the seafloor they can build large mounds that may be up to 50 km in diameter and 2.6 km high. Mud volcanoes produce new habitats for living organisms, but have not been well-explored, so we know very little about mud volcano ecosystems.

In this lesson, students will investigate mud volcanoes and their relationship to the motion of tectonic plates.

### Learning Procedure

1. To prepare for this lesson:
  - a. Review background information about the 2016 Deepwater Exploration of the Marianas expedition. [<http://oceanexplorer.noaa.gov/oceanos/explorations/ex1605/welcome.html>]
  - b. Review “The Geology of the Mariana Convergent Plate Region” by Bill Chadwick and Patty Fryer [<http://oceanexplorer.noaa.gov/oceanos/explorations/ex1605/background/geology/welcome.html>].
  - c. Review the Multimedia Discovery Mission, Plate Tectonics (Lesson 1) [<http://oceanexplorer.noaa.gov/edu/learning/welcome.html#lesson1>]. Decide whether your students will be able to understand this presentation on their own, or whether you want to use the slides with your own narration and explanations.

sites, there are important differences that make direct comparison of these sites inappropriate. In particular, (a) the Mariana mud volcano processes involve fluids from the subducting plate (which are NOT seawater); (b) Lost city serpentinization is happening on the seafloor, not in the underlying mantle as is the situation at the Mariana mud volcanoes; and (c) while both sites have chemoautotrophic communities, the organisms are different between these sites.

Assign each student group to prepare a model of a typical magma volcano of the Mariana Islands, a model of a serpentine mud volcano or a model of a sediment-derived mud volcano.

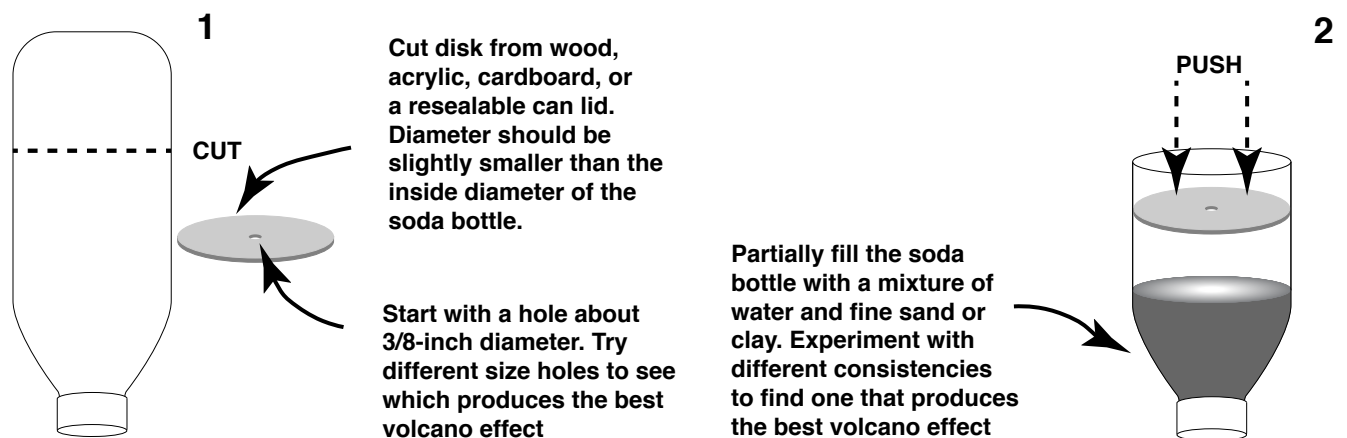

Students who are assigned to make magma volcano models should visit [http://volcano.oregonstate.edu/vwdocs/volc\\_images/southeast\\_asia/mariana/basic\\_geology.html](http://volcano.oregonstate.edu/vwdocs/volc_images/southeast_asia/mariana/basic_geology.html), and model one of the volcanic islands described (Agrigan, Alamagan, Anatahan, Asuncion, Farallon de Pajaros, Guguan, Maug, Pagan, or Sarigan). Once they have selected a volcano, students should select one of the modeling techniques described at <http://volcano.oregonstate.edu/book/export/html/208>. The play dough, paper and cardboard, topographic cardboard, and simple clay techniques are most appropriate for this assignment. Depending upon available time and your tolerance for chaos, you may decide to allow students to include eruptions in their models. Each student group should prepare a brief written report describing the volcanic processes that formed the Mariana Arc.

Students who are assigned to make serpentine mud volcano models should visit <http://volcano.oregonstate.edu/book/export/html/208>, and review ideas for air pressure volcano models. A simpler version than the ones described on this Web page can be made inside a 2-liter soda bottle as illustrated in Figure 1. Students may use fine sand, ground coffee, or table salt to simulate serpentine muds. The size of the volcano cone will depend on the amount of "mud" in the "fault." Students may experiment with different size faults to increase the amount of "mud" available, or try the T-connector and funnel system shown in the diagram "Model for Tephra eruptions" on the Web page. Students may also try adding water to the container, but this will significantly increase the potential for messiness, and eliminate salt and coffee (or any other soluble material) for simulating serpentine mud. Each student group should

**Mud Volcano**

the island arc. Because of the extreme depths of the Mariana Trench, there are almost certainly many volcanoes that have not been discovered, and most have not been studied in any detail.

### The BRIDGE Connection

[www.vims.edu/bridge/](http://www.vims.edu/bridge/) – Enter “Mariana” in the search bar to access resources about the Mariana Arc and other volcanic regions.

### The “Me” Connection

Have students write a brief essay discussing why exploration of remote ocean regions such as the Mariana Trench might be of personal significance.

### Connections to Other Subjects

English/Language Arts, Social Studies

### Assessment

Participation in class discussions and group models provide opportunities for assessment.

### Extensions

Visit <http://oceanexplorer.noaa.gov/oceanos/explorations/explorations.html> for links to individual voyages of discovery by NOAA Ship *Okeanos Explorer*.

### Other Relevant Lessons from NOAA's Ocean Exploration Program

#### The Volcano Factory (Grades 5-6)

from the 2006 Submarine Ring of Fire Expedition

[<http://oceanexplorer.noaa.gov/explorations/06fire/background/edu/media/ROF06.VolFactory.pdf>]

Focus: Volcanism on the Mariana Arc (Earth Science)

Students explain the tectonic processes that result in the formation of the Mariana Arc and the Mariana Trench; and explain why the Mariana Arc is one of the most volcanically active regions on Earth.

#### It's Going to Blow Up! (Grades 7-8)

from the 2006 Submarine Ring of Fire Expedition

[<http://oceanexplorer.noaa.gov/explorations/06fire/background/edu/media/ROF06.BlowUp.pdf>]

Focus: Volcanism on the Pacific Ring of Fire (Earth Science)

Students describe the processes that produce the Submarine Ring of Fire; explain the factors that contribute to explosive volcanic eruptions; identify at least three benefits that humans derive from volcanism; describe the primary risks posed by volcanic activity in the United States; and identify the volcano within the continental U.S. that is considered most dangerous.

### Other Resources

*The Web links below are provided for informational purposes only. Links outside of Ocean Explorer have been checked at the time of this page's publication, but the linking sites may become outdated or non-operational over time.*

<http://egsc.usgs.gov/isb/pubs/teachers-packets/volcanoes/> – links to an interdisciplinary set of materials for grades 4-8 with activities that incorporate earth science, other sciences, social studies, language arts, and mathematics; contents include: a two-sided color poster, teaching guide (with glossary and bibliography), six lesson plans with timed activities (activity sheets in PDF format), and an evaluation sheet

### Next Generation Science Standards

#### MS-ESS2 Earth's Systems

*Performance Expectation*

MS-ESS2-3. Analyze and interpret data on the distribution

of fossils and rocks, continental shapes, and seafloor structures to provide evidence of the past plate motions  
[Clarification Statement: Examples of data include similarities of rock and fossil types on different continents, the shapes of the continents (including continental shelves), and the locations of ocean structures (such as ridges, fracture zones, and trenches).]  
[Assessment Boundary: Paleomagnetic anomalies in oceanic and continental crust are not assessed.]

### Science and Engineering Practices

#### *Analyzing and Interpreting Data*

- Analyze and interpret data to provide evidence for phenomena

#### Connections to Nature of Science

##### *Scientific Knowledge is Open to Revision in Light of New Evidence*

- Science findings are frequently revised and/or reinterpreted based on new evidence.

### Disciplinary Core Ideas

#### *ESS2.B: Plate Tectonics and Large-Scale System Interactions*

- Maps of ancient land and water patterns, based on investigations of rocks and fossils, make clear how Earth's plates have moved great distances, collided, and spread apart.

### Crosscutting Concepts

#### *Patterns*

- Patterns in rates of change and other numerical relationships can provide information about natural systems.

#### *Common Core State Standards Connections:*

##### *ELA/Literacy –*

- RST.6-8.1 Cite specific textual evidence to support analysis of science and technical texts.
- RST.6-8.7 Integrate quantitative or technical information expressed in words in a text with a version of that information expressed visually (e.g., in a flowchart, diagram, model, graph, or table).
- RST.6-8.9 Integrate and evaluate multiple sources of information presented in diverse formats and media (e.g., quantitative data, video, multimedia) in order to address a question or solve a problem.

**Mathematics –**

MP.2 Reason abstractly and quantitatively.

6.EE.B.6 Use variables to represent numbers and write expressions when solving a real-world or mathematical problem; understand that a variable can represent an unknown number, or, depending on the purpose at hand, any number in a specified set.

7.EE.B.4 Use variables to represent quantities in a real-world or mathematical problem, and construct simple equations and inequalities to solve problems by reasoning about the quantities.

**Ocean Literacy Essential Principles and Fundamental Concepts**

Essential Principle 1.

Earth has one big ocean with many features.

*Fundamental Concept h.* Although the ocean is large, it is finite, and resources are limited.

Essential Principle 2.

The ocean and life in the ocean shape the features of Earth.

*Fundamental Concept e.* Tectonic activity, sea level changes, and the force of waves influence the physical structure and landforms of the coast.

Essential Principle 6.

The ocean and humans are inextricably interconnected.

*Fundamental Concept b.* The ocean provides food, medicines, and mineral and energy resources. It supports jobs and national economies, serves as a highway for transportation of goods and people, and plays a role in national security.

*Fundamental Concept d.* Humans affect the ocean in a variety of ways. Laws, regulations, and resource management affect what is taken out and put into the ocean. Human development and activity leads to pollution (point source, nonpoint source, and noise pollution), changes to ocean chemistry (ocean acidification), and physical modifications (changes to beaches, shores, and rivers). In addition, humans have removed most of the large vertebrates from the ocean.

*Fundamental Concept g.* Everyone is responsible for caring for the ocean. The ocean sustains life on Earth and humans must live in ways that sustain the ocean. Individual and collective actions are needed to effectively manage ocean resources for all.

### Essential Principle 7.

The ocean is largely unexplored.

*Fundamental Concept b.* Understanding the ocean is more than a matter of curiosity. Exploration, experimentation, and discovery are required to better understand ocean systems and processes. Our very survival hinges upon it.

*Fundamental Concept c.* Over the last 50 years, use of ocean resources has increased significantly; the future sustainability of ocean resources depends on our understanding of those resources and their potential.

*Fundamental Concept f.* Ocean exploration is truly interdisciplinary. It requires close collaboration among biologists, chemists, climatologists, computer programmers, engineers, geologists, meteorologists, physicists, animators, and illustrators. And these interactions foster new ideas and new perspectives for inquiries.

### Send Us Your Feedback

In addition to consultation with expedition scientists, the development of lesson plans and other education products is guided by comments and suggestions from educators and others who use these materials. Please send questions and comments about these materials to:
