\* CBCC – Chemical, Biological & Cultural Control  
 EEDF – Etiology, Epidemiology & Disease Forecasting  
 FSTU – Food Safety, Toxicology, & Utilization of Mycotoxin-contaminated Grain  
 GET – Genetic Engineering & Transformation  
 HGR – Host Genetics Resources  
 HGG – Host Genetics & Genomics  
 IIR – Integrated/Interdisciplinary Research  
 PGG – Pathogen Genetics & Genomics  
 VDUN – Variety Development & Uniform Nurseries

**Project 1:** *Diagnostic Services for DON.*

**1. What major problem or issue is being resolved and how are you resolving it?**

Our laboratory provided deoxynivalenol (DON) and related mycotoxin diagnostic services for Fusarium Head Blight (Scab) research projects conducted by 34 PIs in 14 states last year. The major issue that we dealt with was how to efficiently handle huge amounts of samples submitted by so many groups and ensure researchers to get their results in a timely manner. In general, we analyzed samples based on a first come, first served policy. In case we received large amounts of samples from a single group or received several submissions from different groups around same time, we contacted PI(s) about their desired dates of having DON results for each set of their samples and adjusted samples analysis schedules to make sure that each PI could receive their results in a reasonable time frame. By doing so, we were able to provide DON results to most PIs within one month after receiving their samples.

**2. List the most important accomplishment and its impact (how is it being used?).  
Complete all three sections (repeat sections for each major accomplishment):**

**Accomplishment:**

From May 2007 to April 2008, the Mycotoxin Diagnostic Laboratory at the University of Minnesota analyzed 29,217 samples, which was 2.1 times the number of samples analyzed last year (13,873) and 42.5% more than the estimate (20,500) presented in the proposal. The huge increase of samples reflected the great needs of DON analysis by the scab research community. The samples were submitted by 34 scab research groups from 14 states including Minnesota, Kansas, Michigan, New York, Arkansas, Indiana, South Dakota, Illinois, Kentucky, Louisiana, Ohio, North Carolina, Maryland, and Virginia. They included 20,299 regular mature grain samples (6-100 g) and 8,918 small size samples such as single kernels, single spikeletes, single heads, small stems, and fungal cultures extracts. The target toxins included DON, 15-Acetyl-DON, 3-Acetyl-DON, nivalenol and zearalenone. Ergosterol, a chemical marker for measuring fungal biomass, was also analyzed for some samples as requested by researchers.

**Impact:**

The DON data has been used in all areas of scab research. By analyzing mycotoxins, the project provided support to barley and wheat breeding programs to develop resistant varieties, and to researchers to study disease mechanisms and to develop effective and economical chemical and biological disease controls.

**As a result of that accomplishment, what does your particular clientele, the scientific community, and agriculture as a whole have now that they didn't have before?:**

Mycotoxin data provided to scab researchers by our laboratory gave researchers a means to evaluate the effectiveness of their efforts in fighting Fusarium Head Blight.

**Include below a list of the publications, presentations, peer-reviewed articles, and non-peer reviewed articles written about your work that resulted from all of the projects included in the grant. Please reference each item using an accepted journal format. If you need more space, continue the list on the next page.**
