Project ID: FY08-ST-081

FY08 ARS Agreement #: 59-0790-4-107

Research Category: BAR-CP/MGMT

Duration of Award: 1 Year

Project Title: Development and Validation of FHB and DON Predictive Models for Barley.

PROJECT 1 ABSTRACT

(1 Page Limit)

Fusarium head blight (FHB) continues to be a serious problem for malting barley growers in the U.S. and Canada. The most effective management of this disease occurs when an integrated approach is taken that combines a resistant variety, appropriately timed fungicide application, and the management of in-field inoculum. However, the currently available tools are not feasible in all situations, nor completely effective at limiting disease or mycotoxin accumulation in grain; therefore, additional strategies need to be investigated in order to reduce the impacts of this disease on wheat and barley production.

Currently, no predictive systems are in place for barley and the need exists in many locations in the U.S. With the limited options available for chemical control of FHB and the low level of resistance in adapted varieties, additional management tools are needed. We propose to develop predictive models specifically for barley that utilize weather in the forecasting of FHB disease severity and DON accumulation.

This project is part of a larger collaborative effort attempting to model these two factors for both wheat and barley in the United States. Specific project objectives for this period of work are to continue: 1) contributing to the development of an experimental database containing information on cultural practices, weather, and resulting field disease and mycotoxin levels for barley and 2) model development and validation for FHB and DON accumulation in barley.
