

**USDA-ARS/  
U.S. Wheat and Barley Scab Initiative  
FY11 Preliminary Final Performance Report  
July 13, 2012**

**Cover Page**

<b>PI:</b>	Mohamed Mergoum
<b>Institution:</b>	North Dakota State University
<b>Address:</b>	Department of Plant Sciences Rm 166 Loftsgard Hall Fargo, ND 58105-5051
<b>E-mail:</b>	Mohamed.Mergoum@ndsu.edu
<b>Phone:</b>	701-231-8478
<b>Fax:</b>	701-231-8474
<b>Fiscal Year:</b>	FY11
<b>USDA-ARS Agreement ID:</b>	59-0206-9-065
<b>USDA-ARS Agreement Title:</b>	Combining Resistance Sources to Produce FHB Resistant Specialty Spring Wheat Varieties.
<b>FY11 USDA-ARS Award Amount:</b>	\$ 28,054

**USWBSI Individual Project(s)**

<b>USWBSI Research Category*</b>	<b>Project Title</b>	<b>ARS Award Amount</b>
VDHR-SPR	Development of Spring White and Specialty Wheat Cultivars Resistant Scab Disease.	\$ 28,054
	<b>Total ARS Award Amount</b>	<b>\$ 28,054</b>

Principal Investigator \_\_\_\_\_ Date 06/06/12

\* MGMT – FHB Management  
 FSTU – Food Safety, Toxicology, & Utilization of Mycotoxin-contaminated Grain  
 GDER – Gene Discovery & Engineering Resistance  
 PBG – Pathogen Biology & Genetics  
 BAR-CP – Barley Coordinated Project  
 DUR-CP – Durum Coordinated Project  
 HWW-CP – Hard Winter Wheat Coordinated Project  
 VDHR – Variety Development & Uniform Nurseries – Sub categories are below:  
 SPR – Spring Wheat Region  
 NWW – Northern Soft Winter Wheat Region  
 SWW – Southern Soft Red Winter Wheat Region

**Project 1:** *Development of Spring White and Specialty Wheat Cultivars Resistant Scab Disease.*

**1. What major problem or issue is being resolved relevant to Fusarium head blight (scab) and how are you resolving it?**

Scab or Fusarium head blight (FHB) is a major threat to wheat production in many parts of the world, particularly in the Northern Central plains of the USA. It causes significant losses in wheat grain yield and its quality due to the accumulation of fungal mycotoxins, such as deoxynivalenol (DON). In the US spring wheat region, these losses are estimated to billions of dollars afflicted to wheat growers, industry, and export market. Hard white and specialty spring wheat (HWSW) genotypes resistant to FHB are needed by regional producers to remain competitive in domestic and international markets. A successful wheat breeding approach has been to combine different sources of host FHB resistance, including Types I and II resistances, into a single genotype. This has been done successfully in the hard red spring wheat (HRSW) breeding program and should be implemented in our HWSW breeding program as well.

At NDSU, ND, the HWSW breeding program is addressing this problem by initiating/reinforcing the development of elite and adapted genotypes/ lines/cultivars and breeding populations that incorporate genetic resistance with desired agronomic and quality traits. The strategy used is based on importing/incorporating/pyramiding several types of genetic resistance to FHB, particularly from our adapted HRSW sources. These include Glenn, Alsen, Faller, Prosper, and Steele-ND. These genes are being incorporated into adapted HWSW lines using classical breeding methods and appropriate novel technologies such as selected molecular markers. Based on our experience, we strongly believe that genetic resistance is/will provides a strategic long-term, economically, and environmentally sound solution to the problem. In 2011-2012 growing cycle, our efforts have continued to generate new crosses and generating new populations involving parents with FHB resistance. We have also included some HWSW lines from advanced generations in our trials. Our goal is to develop elite HWSW germplasm that are adapted to ND in particular, and spring wheat region, in general.

Also, to evaluate the function of types I resistance genes, a graduate student, Mr. Dalitso Yabwalo was hired in 2008 to conduct this research. Previously developed reciprocal backcross monosomic lines developed by hybridizing FHB resistant spring wheat 'Frontana' to a set of 'Chris' spring wheat monosomics, which are susceptible to FHB were used in Mr. Dalitso Yabwalo study. This work has been completed in 2010 and the results were published in Plant Breeding journal in 2011.

**2. List the most important accomplishment and its impact (i.e. how is it being used) to minimize the threat of Fusarium head blight or to reduce mycotoxins. Complete both sections (repeat sections for each major accomplishment):**

**Accomplishment:**

Past USWBSI funds have allowed the development of several spring wheat lines including NDSW0714 and NDSW0715, were developed such that they contained one and two QTL for FHB resistance, respectively. Also, using other grants funded by the USWBSI funding, many HRSW cultivars have been developed in the last decades with excellent agronomic and quality performance and good levels of FHB resistance. These include Glenn, Faller, Steele-ND, Howard, Barlow, and many other new lines recently released or are in the pipeline of our HRSW breeding program. These genotypes have been used extensively in generating more than hundreds of crosses and segregating populations in past years. This material from these germplasm was selected for FHB and is being advanced in the HWSW breeding pipeline.

Breeding for developing HWSW germplasm with FHB resistance really started in 2009. Past USBSI funding, although may affect breeding, was rather for specific projects. This current project is in its third year. About 100 crosses involving HWSW and HRSW parents to generate HWSW germplasm with FHB resistance was done in 2011. About 100, 1300, 350, 256, 60, 40, and 40 F2 population, F3 families, F4, PYT, IYT, AYT, and EYT lines respectively were screened in 2011 filed nurseries including FHB scab. The screening of the above white/specialty wheat genotypes under scab nursery conditions (artificial inoculation and mist irrigation) was continued at three locations in ND in 2011. Based on data from previous work, many genotypes were selected and identified. Field data was supplemented by the molecular markers information from the USDA-ARS Fargo Genotyping Center to make final selection of resistant genotypes that combine different sources of resistance. This material is being advanced for tests in 2012 nurseries.

A student, Mr Dalitso Yabwalo was funded by the USWBSI has finished his study on the evaluation of the monosomics lines to determine the function of both type I resistance. These results were submitted to Plant Breeding Journal for publication. The manuscript was accepted in 2011 and currently is in press. The results demonstrate that 3A is a major genomic region for FHB resistance; therefore, mapping and cloning efforts should focus on this chromosome. The results also indicated the involvement of chromosomes 6A and 4D in reducing FHB spread although to a lesser extent than 3A.

**Impact:**

The impact from developing HWSW cultivars adapted to ND in particular and the spring region in general can be significant given that this class of wheat can expand to larger acreages in the spring wheat region. The use of white wheat for producing ‘whole wheat’ flour is certainly more appealing for end-users than other red wheats. This type of wheat is also very desirable for the export market such as producing noodle in Asia. Therefore the

impact of developing HWSW with FHB resistance may be substantial. Millions of dollars could be generated by growing such as cultivars as is in the case of our HRSW developed by NDSU HRSW breeding program. The results of this project will allow us to identify white and specialty wheat genotypes with good FHB resistance.

Previously, we have indicated that the funding of a graduate student by the USWBSI study has generated good results that may have an impact for our breeding program and the other breeding programs dedicated to pyramid FHB resistance genes. The results for the this study ( Yabwalo et al., 2011) indicated the importance of the type I FHB resistance from Frontana and its benefits in pyramiding genes for FHB, which will be demonstrated by a decrease in the level of disease severity over time. The above results provide information to us and other breeders if pyramiding genes will be useful in developing host plant resistance to FHB, and it ultimately will result in the release of a spring wheat germplasm line which combines two different genes for resistance to FHB. These results can be used also to demonstrate if molecular markers can be effectively employed to pyramid different genes, despite these genes expressing a similar Type II phenotypic resistance to FHB.

**Include below a list of all germplasm or cultivars released with full or partial support of the USWBSI. List the release notice or publication. Briefly describe the level of FHB resistance.**

Previously, the NDSW0714 and NDSW0715 were released as germplasm using part of USWBSI funds.

**Include below a list of the publications, presentations, peer-reviewed articles, and non-peer reviewed articles written about your work that resulted from all of the projects included in the grant. Please reference each item using an accepted journal format. If you need more space, continue the list on the next page.**
