

Project Abstract

Project Title:	Diagnostic Services for DON	
Principal Investigator:	Yanhong Dong	University of Minnesota

The goal of this project is to provide rapid, cost-effective, and accurate mycotoxin analysis - especially deoxynivalenol (DON) - for Fusarium Head Blight (FHB or scab) research projects.

The project will use gas chromatography-mass spectrometry (GC-MS) to provide quick and accurate measurement for: 1) DON and related mycotoxins, such as 3-acetyl-DON, 15-acetyl-DON and nivalenol (NIV); 2) Zearalenone for the projects approved by the executive committee; 3) mycotoxins in mature wheat and barley seeds as well as individual kernel, spikelet, head, small leaf and stem fragment at different disease development stages and fungal culture extract; 4) 32,291 DON samples for FY22 from 46 FHB research groups and 23 states including Arkansas, Georgia, Idaho, Illinois, Indiana, Kansas, Kentucky, Louisiana, Maryland, Michigan, Minnesota, Missouri, Montana, Nebraska, New York, North Carolina, North Dakota, Ohio, Pennsylvania, Tennessee, Texas, Washington, and Wisconsin.

The DON data provided by the services is essential to breeding (traditional and molecular) programs aiming at developing wheat and barley varieties with improved resistance to the disease and DON contamination, and has been used for epidemiology, genetics and molecular studies of the host, pathogen, and host-pathogen interaction aiming at improving our understanding of resistant mechanisms to FHB and mycotoxin production. The services have provided support to the efforts of developing integrated management strategies and effective disease control practices. The services have also assisted the developments of other rapid DON screening methods such as IR and Raman. The mycotoxin data provided to FHB researchers by the services gives researchers a means to evaluate the effectiveness of their efforts in fighting Fusarium Head Blight.

The DON analysis service will be available year around for FHB research projects. Turnaround time will be between one week and two months depending on volumes of samples. The request for FY22 is \$316,827. We anticipate 3% annual increase for each of the following three years. The total request for the duration of 4 years is \$1,325,484. Individual projects will not be charged for toxin analysis.
