USDA-ARS | U.S. Wheat and Barley Scab Initiative

FY21 FINAL Performance Progress Report

Due date: July 26, 2023

Cover Page

USDA-ARS Agreement ID:	59-0206-0-160
USDA-ARS Agreement Title:	Transfer of FHB Resistance to NDSU Hard Red Winter Wheat Breeding Material
Principle Investigator (PI):	G. Francois Marais
Institution:	North Dakota State University
Institution UEI:	EZ4WPGRE1RD5
Fiscal Year:	2021
FY21 USDA-ARS Award Amount:	$58,437
PI Mailing Address:	North Dakota State University, Department of Plant Sciences Dept. 7670, PO Box 6050 Fargo, ND 58108-6050
PI E-mail:	gideon.marais@ndsu.edu
PI Phone:	701-231-8155
Period of Performance:	6/1/21 - 5/31/23
Reporting Period End Date:	7/9/2023

USWBSI Individual Project(s)

USWBSI Research Category*	Project Title	ARS Award Amount
HWW-CP	Transfer of FHB Resistance to NDSU Hard Red Winter Wheat Breeding Material	$58,437
	FY21 Total ARS Award Amount	$58,437

I am submitting this report as a: ☒ FINAL Report

I certify to the best of my knowledge and belief that this report is correct and complete for performance of activities for the purposes set forth in the award documents.

Project 1: Transfer of FHB Resistance to NDSU Hard Red Winter Wheat Breeding Material

---

1. **What are the major goals and objectives of the research project?**
   1. Increase (annually) the frequencies of four FHB resistance genes within the NDSU breeding population through careful planning and execution of new convergent crosses coupled with marker screening and agronomic evaluation of the segregating progenies.
   2. Hasten the selection of high yielding, FHB resistant inbred lines in each of three 2-year selection studies. Specific, well-chosen crosses will be employed and large numbers of progeny will be extensively evaluated.
   3. Initiate (annually, in a greenhouse) the development of 500-600 new (near-random) single seed descent (SSD) inbred lines from select crosses that each segregate for one or more FHB resistance QTL (plus resistance to the wheat rusts). From the second year, the F_4 populations will be grown in the field for resistance selection and pure line development.
   4. Conduct an annual Winter Wheat x Fungicide performance trial (field) to evaluate the response of advanced breeding lines and controls to fungicide application for the reduction of DON content.
2. **What was accomplished under these goals or objectives?** *(For each major goal/objective, address these three items below.)*

   a) What were the major activities?

   Objective 1: F_2 from 663 crosses (made in 2021) were planted for field selection in 2022. 521 new (2022) crosses were made among 55 parents that were primarily identified from among field planted routine NDSU breeding program material. FHB phenotyping of segregating populations was not effective due to no/irregular natural infection. However, marker analyses performed at the ARS Genotyping Center in Fargo, plus marker and phenotyping data from the Northern FHB Screening Nursery, NRPN, RGON and ARS Genotyping laboratory at KSU were used to identify resistant parents. Of the 521 new crosses, 325 involved one or more FHB resistant parent (primarily *Fhb1*, but also *Qfhs.ifa-5A*, *Qfhb.rwg-5A.1*, *Qfhb.rwg-5A.2* and the Everest 2DL_QTL). Use of a highly specific *Fhb1* marker allows for rapid progress in establishing the gene; however, lack of universal markers for the remaining genes seriously hampers their introgression.
   Objective 2. Study (i): The transfer of *Qfhb.rwg-5A.1* and *Qfhb.rwg-5A.2* from PI277012 (in GP80) to HRWW was completed. A winter wheat B_3F_1 population (GP80/Novus-4//Monument/3/2*ND Noreen) of 132 plants was evaluated for SNP haplotypes (Infinium wheat 90K SNP platform), two SSR markers and FHB Type II resistance (greenhouse). Eight resistant lines were derived (the *Qfhb.rwg-5A.2* markers occurred in all eight and the *Qfhb.rwg-5A.1* markers occurred in four lines) and confirmed in a further FHB trial. The selections were already used in the 2022 crossing block. Study (ii) aimed to develop semi-dwarf inbred lines that are FHB resistant, winter-hardy, high-yielding, and also leaf, stem, and stripe rust resistant from crosses among eight winter wheat genotypes with the desired traits. Greenhouse-based SSD inbreeding with phenotypic selection was used to develop F_3-derived F_4 populations for grain yield testing in an un-replicated field trial. Four spikes were selected from each of the nine highest yielding families. Five seeds from each selected spike were used for marker-based selection. Study (iii): A double cross (16M10) was subjected early generation yield selection in an attempt to derive high yielding lines with *Fhb1*.

Following modified SSD inbreeding from a large F_1 population, near-random $F_{3:4}$ inbred lines were established and planted in an un-replicated yield trial. The 40 best $F_{3:5}$ lines were again planted in a replicated yield trial. The highest yielding selections were then analyzed with markers to establish inbred lines.

Objective 3: Annually, SSD inbreeding is initiated from 30-40 promising (high yield with resistance to FHB and other diseases) cross combinations to achieve generation acceleration. SSD is cheaper than doubled haploid development and in line with the project's available resources. The chosen crosses have at least one parent that is believed to be FHB resistant. F_2 seedlings (± 96 plants/cross) are screened with mixed leaf and stem rust inoculum and during all stages of inbreeding the plants are selected (greenhouse) for height and fertility. The $F_{2:3}$ is planted in the field in the fall and subjected to single plant selection in the ensuing summer. Three sets of SSD selections have been handled in this manner during the report period.

Objective 4: A variety X fungicide evaluation trial with 22 entries was planted at Casselton. The trial followed a split plot layout (three replicates) with half of the plots treated with Prosaro at 8.2 fl oz/acre at flowering (applied on 6/4, 6/7, 6/9, and 6/11 to allow for variation in flowering dates among the varieties). Corn inoculum (FHB) was applied on 5/26/21 and 5/28/21 (the earliest varieties started to head around 6/1/21).

b) What were the significant results?

Objective 1: The presence (marker detected) of resistance QTL *Fhb1* (and to a lesser extent *Qfhs.ifa-5A*) increased markedly among advanced inbred lines. In 2022, 10 of the 23 State-wide Elite Trial entries had *Fhb1* (three of these were also included in the NRPN and seven in the RGON). Of the 180 advanced (Senior) yield trial entries, 68 had *Fhb1*. With regard to the 554 new Junior Trial inbred lines, 357 had *Fhb1*. *Fhb6*, *Qfhb.rwg-5A.1*, *Qfhb.rwg-5A.2* and the Everest 2DL_QTL were introduced for the first time in the F_2 to F_3 generations. The segregating populations and inbred lines were furthermore evaluated for multiple adaptive (ND) traits. Phenotyping and marker selection (where appropriate markers were available) were done to also raise the presence of resistance to the cereal rust diseases and increase the possibility to develop inbred lines with broad disease resistance.

Objective 2. Study (i): *Qfhb.rwg-5A.1* and *Qfhb.rwg-5A.2* have small individual effects and were difficult to transfer in the absence of reliable markers; however, we could identify and apply SNP haplotypes to aid transfer. Eight homozygotes for one or both resistance genes were obtained following three backcrosses to winter wheat (approximately 93% winter wheat background recovered). The selections had resistance similar to the spring wheat donor and were calculated to have 75% to 82% of ND Noreen genetic background. ND Noreen is believed to have background FHB resistance that bolsters the PI277012-derived resistance. Derivatives with the genes are being evaluated further and will be applied in a wide range of new crosses. Markers *Xbarc186* (*Qfhb.rwg-5A.1*), *Xgwm2136* and KASP marker 5AL-8.0K (*Qfhb.rwg-5A.2*) could be useful for predicting the presence of the respective genes; however, both *Xbarc186* and KASP-5AL-8.0K give parent-specific polymorphisms that limit their usefulness. *Xgwm2136* appears to produce a unique polymorphism associated with the resistance, yet the marker may be less tightly linked to the resistance. Study (ii): Two of the nine originally selected (yield) F_4-derived families completely lacked *Fhb1,* whereas the remaining seven families were homozygous for *Fhb1*. Following the marker screens, 140 F_5-derived inbred lines with *Fhb1* and additional favorable (marker-predicted) resistance gene combinations were established from the

seven families for continued yield testing. In addition to *Fhb1*, the presence of rust resistance genes *Lr34* (58%), *Lr46* (46%), *Lr68* (52%), *Yr17* (71%) and the 1BL.1RS translocation (15%) could also be determined. Few reliable and specific disease resistance markers are available in wheat, and it is highly likely that additional rust, bacterial leaf streak and tan spot resistance genes that were present among the parents will also occur among the progeny. The selections were planted in the field as single rows in September 2022. Study (iii): Based on the marker results and phenotypes in observation/increase rows, four cross 16M10 lines with the *Fhb1* and rust resistance gene markers were singled out for further testing and included in the 2022 Preliminary (Junior) yield trials.

Objective 3: In 2022, three sets of SSD material were handled, including: (i) 501 F_4 rows derived from 40 crosses made in 2020 (planted at Casselton in September 2021). Selections from these rows will progress to F_5 head rows (planted in September 2022). (ii) 656 F_3 rows that derive from 44 crosses made in 2021 (planted at Casselton in September 2021). Following selection, F_4 rows will be planted in September 2022. (iii) F_1 of new 31 cross combinations (made in 2022) were greenhouse planted in March 2022. Following greenhouse selection, the $F_{2:3}$ will be field planted (September 2022) together with the other earlier derived SSD derivatives

Objective 4: Very dry growing conditions prevailed throughout the state and no significant incidences of foliar diseases occurred at Casselton in 2021. In the fungicide trial, no significant FHB infection occurred, and no DON analyses were done. There was also no significant effect of the fungicide treatment on any of the traits measured and no differential responses of varieties to fungicide application either. A new (2022) Winter Wheat Variety trial with 22 entries and the same statistical design was planted at Casselton in the fall of 2021.

c) List key outcomes or other achievements.

Based on marker results, *Fhb1* has now been incorporated into a significant proportion of the NDSU winter wheat breeding population and in all phases of the selection scheme. Resistance genes *Ofhb.rwg-5A.1* and *Qfhb.rwg-5A.2* (from spring wheat PI277012) have been transferred into our winter germplasm. The genes are expected to contribute significantly to the ongoing improvement of FHB resistance in winter wheat.

3. What opportunities for training and professional development has the project provided?

Sagar Adhikari. MS thesis title: Pre-breeding to combine disease resistance and agrotype genes in hard winter wheat. Graduated in February 2022.

Bipin Neupane graduated in the spring of 2023: MS thesis subject: A diallel study - Evaluation of winter wheat lines for FHB genetic background resistance.

Bhanu Dangi MS thesis subject: Evaluation of winter wheat for FHB genetic background resistance. Joined the project in January 2022; expected to graduate in the spring of 2024.

4. How have the results been disseminated to communities of interest?

Advanced lines were entered in regional nurseries [NRPN (5); RGON (25); Northern Scab (15); USDA stem rust (100); USDA KS Stripe rust (160); USDA WSU stripe rust (100)] and statewide variety trials [ND (2); SD (1); MN (1); MT (1)]. Data on the submitted material get listed in on-line reports of the respective nurseries. The results of the Variety X Fungicide trial of 2020/21 were incorporated in the NDSU annual publication "North Dakota Hard Red Winter Wheat Trial Results and Selection Guide" (https://www.ndsu.edu/agriculture/ag-hub/publications/north-dakota-hard-red-winter-wheat-variety-trial-results-2021-and-selection).

Publications, Conference Papers, and Presentations

Please include a listing of all your publications/presentations about your FHB work that were a result of funding from your FY21 grant award. Only citations for publications published (submitted or accepted) or presentations presented during the **award period** should be included.

Did you publish/submit or present anything during this award period?

☒ Yes, I've included the citation reference in listing(s) below.
☐ No, I have nothing to report.

Journal publications as a result of FY21 award

List peer-reviewed articles or papers appearing in scientific, technical, or professional journals. Include any peer-reviewed publication in the periodically published proceedings of a scientific society, a conference, or the like.

Identify for each publication: Author(s); title; journal; volume: year; page numbers; status of publication (published [include DOI#]; accepted, awaiting publication; submitted, under review; other); acknowledgement of federal support (yes/no).

Ganaparthi VR, Adhikari S, Marais F, Neupane B, Bisek B. (2023). The use of PI 277012-derived Fusarium head blight resistance QTL in winter wheat breeding. Heliyon. 2023 Apr 5;9(4):e15103. doi: 10.1016/j.heliyon.2023.e15103. PMID: 37089302; PMCID: PMC10119711. Federal support was acknowledged.

Books or other non-periodical, one-time publications as a result of FY21 award

Report any book, monograph, dissertation, abstract, or the like published as or in a separate publication, rather than a periodical or series. Include any significant publication in the proceedings of a one-time conference or in the report of a one-time study, commission, or the like.

Identify for each one-time publication: Author(s); title; editor; title of collection, if applicable; bibliographic information; year; type of publication (book, thesis, or dissertation, other); status of publication (published; accepted, awaiting publication; submitted, under review; other); acknowledgement of federal support (yes/no).

Adhikari, S. (2022). Pre-breeding to combine disease resistance and agrotype genes in hard winter wheat. MS Thesis (accepted February 2022, North Dakota State University). Federal support was acknowledged.

Other publications, conference papers and presentations as a result of FY21 award

Identify any other publications, conference papers and/or presentations not reported above. Specify the status of the publication.
