

Recovery Plan Update on Huanglongbing aka HLB / Citrus Greening

Published October 17, 2006

Charla Hollingsworth, Ph.D.
Associate Director
USDA APHIS PPQ S&T
Center for Plant Health, Science & Technology

The Pathogen

Candidatus Liberibacter asiaticus (cLas)

- Alpha proteobacterium
 - Gram-negative
- Insect vectored
 - Psyllid-transmitted
- Phloem-limited
- Prophage
 - Plasmid and chromosomally integrated
 - Highly variable regions with frequent recombination and reassortment

- Zhou, LJ, et al. 2013. Prophage-mediated population dynamics of cLas in plant and insect hosts. IRCHLB Poster. 4-7 Feb. 2013, Orlando, FL.
- Zhang, S. et al., 2010. Ca. *Liberibacter asiaticus* carries an excision plasmid prophage and a chromosomally integrated prophage that becomes lytic in plant infections. doi: 10.1094/MPMI-11-10-0256.
- Zhou, L. et al., 2011. Diversity and plasticity of the intracellular plant pathogen and insect symbiont *Candidatus Liberibacter asiaticus* as revealed by hypervariable prophage genes with intragenic tandem repeats. doi: 10.1128/AEM.05111-11.

Huanglongbing (HLB) symptoms

The Vector

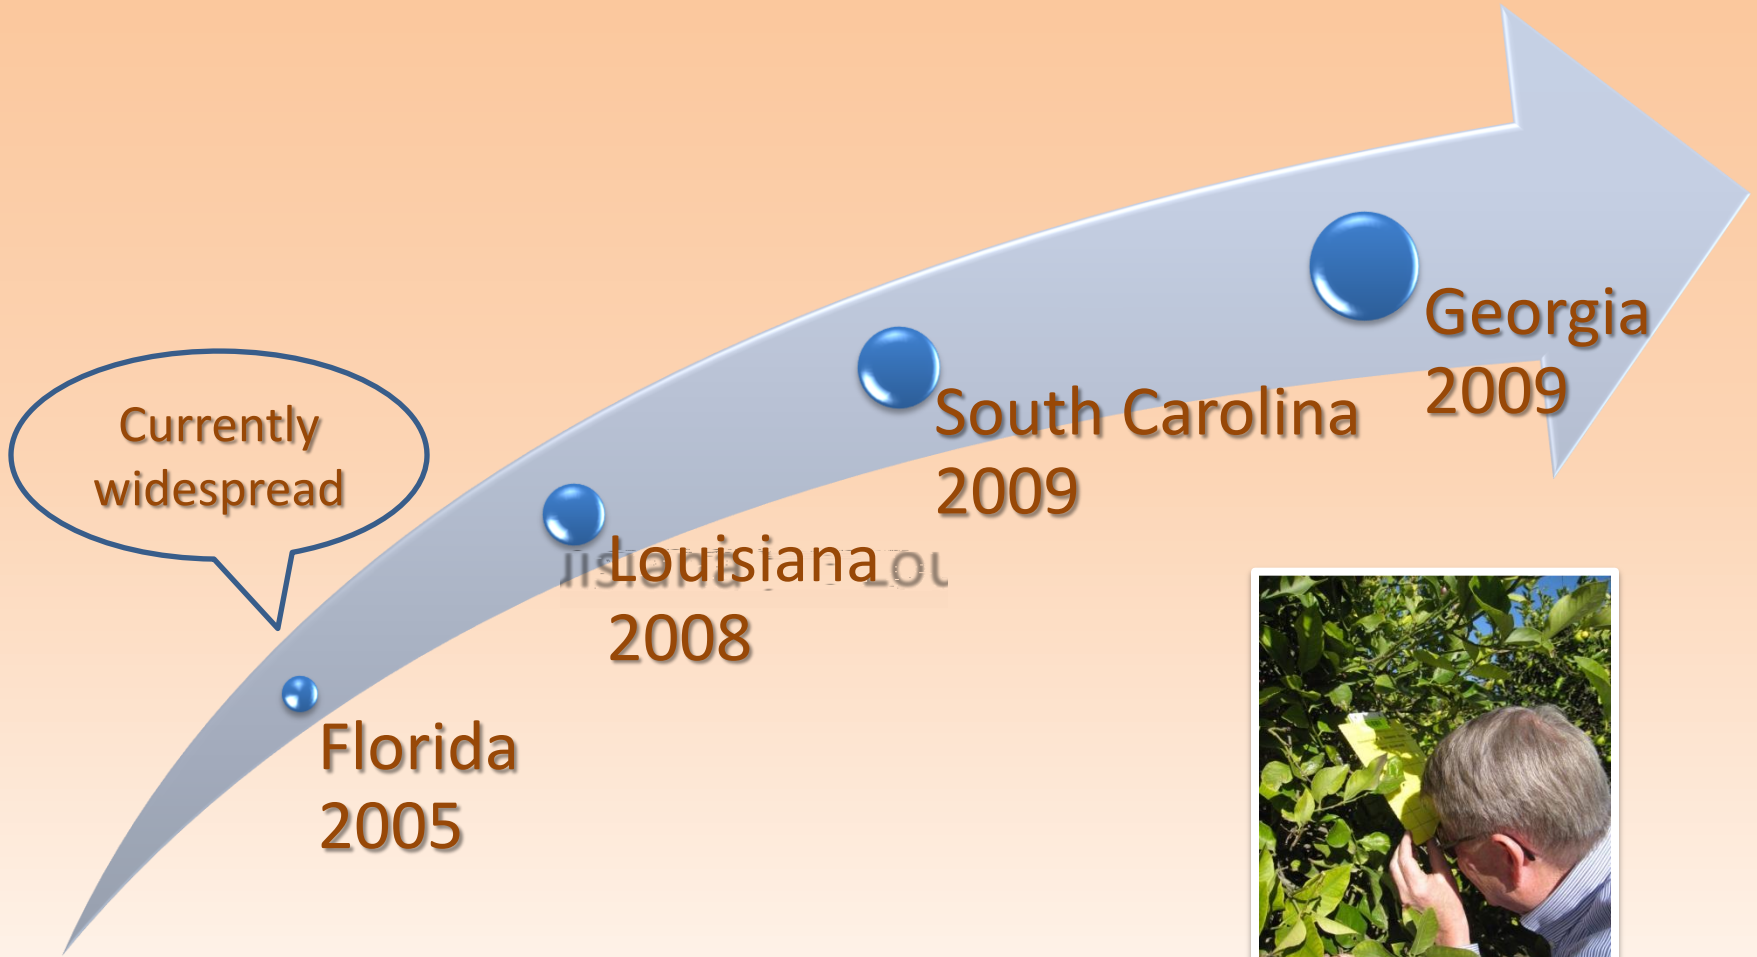

Diaphorina citri, Asian Citrus Psyllid (ACP)

- Females
 - Need new flush
 - Approx. 500-800 eggs in 2 months
 - Optimum
 - temp 29.6C
 - RH > 40%
 - Lifecycle can be 1+ months

Photo by David Bartels

cLas Spread: U.S.

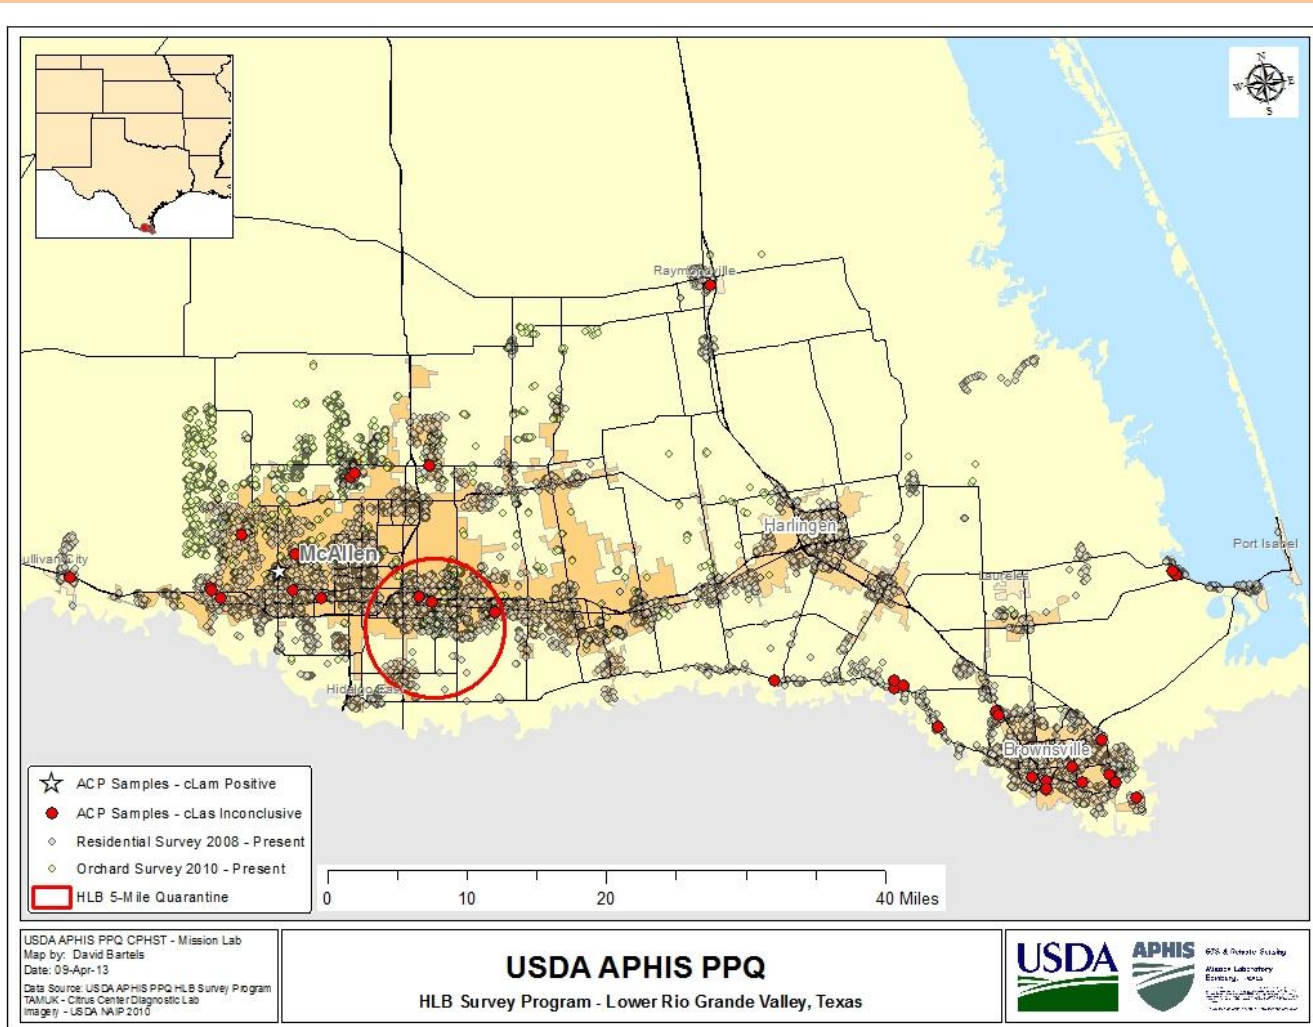

cLas Spread: U.S.

ACP Spread: CA & AZ

ACP Spread: Texas

Monitoring and Detection

- *Plant volatiles and ACP responses.* cLas infected plant host tissues produce methyl salicylate which attracts ACP
 - ACP prefer feeding on newly diseased plants – sufficiently long to acquire cLas
- Diseased plants are deficient in several nutrients (N, Fe, Zn, P)
 - ACP then disperse to non-diseased plants. Hypothesis: seeking a host with increased nutritional content
- Aged, diseased plants are not as a rule attractive to ACP
 - Attraction is increased by applying plant nutritional supplements

Stelinski, LL et al. 2013. Induced release of a plant-defense volatile “deceptively” attracts insect vectors to plants infected with a bacterial pathogen. IRCHLB Poster. 4-7 Feb. 2013, Orlando, FL.

Monitoring and Detection

- *Seasonal shifts in cLas prevalence in ACP.*
Research was conducted in Florida from Jan 2008 to Feb 2012 from 6 sweet orange and 1 lime grove locations
 - cLas prevalence in ACP increased each year at all sites irrespective of management strategy
 - Female ACP cLas prevalence > male ACP
 - Brown-colored ACP cLas prevalence > green-colored ACP
 - Monthly variability
 - Oct through Dec had highest ACP prevalence of cLas

Monitoring and Detection

- *Trap technology.* Chemosensory proteins are under study to identify those molecules that stimulate behavior responses in ACP
 - Commercial experimental product ‘Titan’ induced ACP probing/feeding behavior
 - When mixed with terpenes, these probing levels increased compared with the product alone
 - Male ACP probing behavior was comparable to that expected in the presence of orange jasmine flush
 - Female ACP behavior remained unchanged

Monitoring and Detection

- MesaTech Molecular Diagnostic Platform
 - Handheld, self-contained, disposable
 - No external hardware requirements
 - Reagents enclosed within device
 - Plant tissue + buffer = test sample
 - Electrical adapter or battery powered (standard 9V battery)
 - Easy to use with a bacterial-based pathogen
 - Minimum user steps between sample and result
 - Sensitivity and specificity comparable to lab-based PCR
 - 2 temperature thermocycler amplification
 - Rapid: < 30 minutes sample-to-result

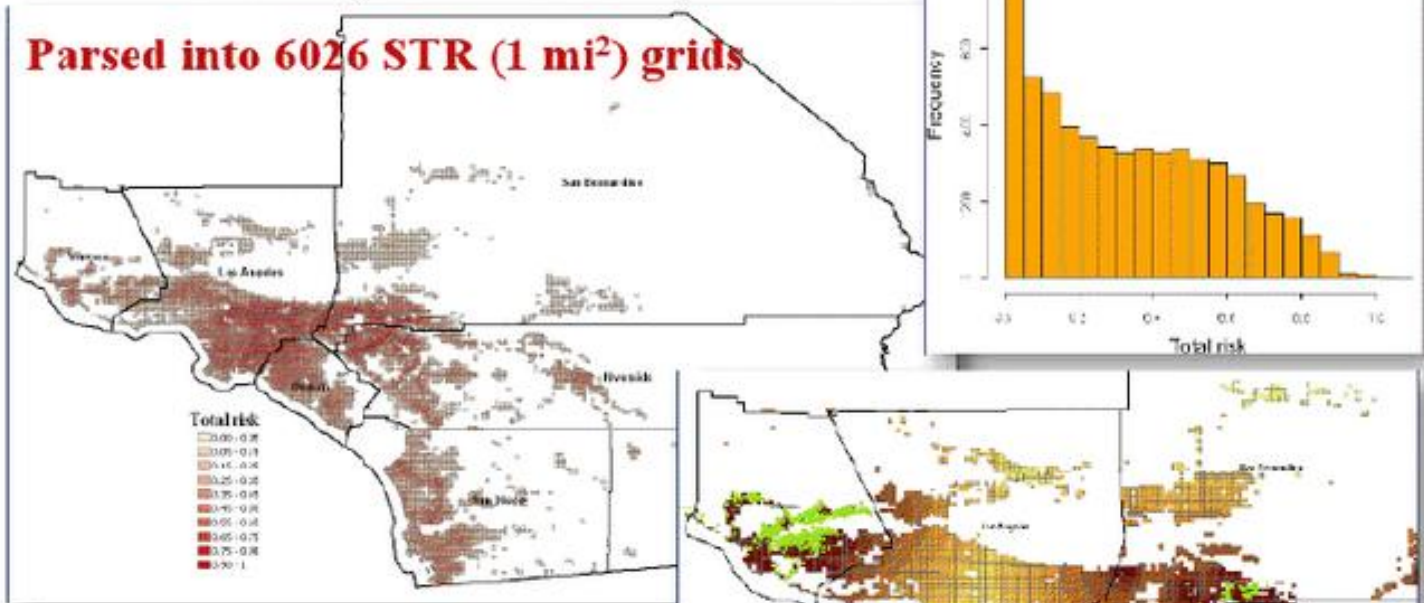

ACP/HLB risk modeling

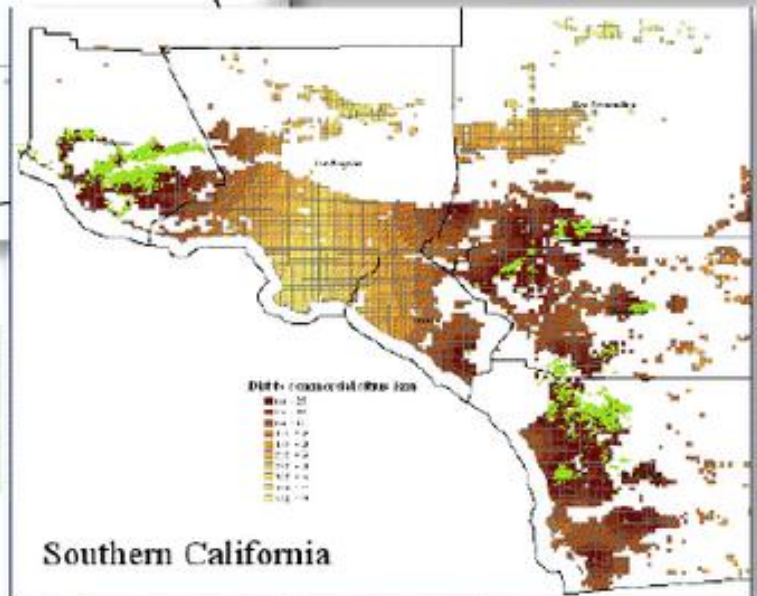

Gottwald, Luo, McRoberts

Total risk (South CA)

Parsed into 6026 STR (1 mi²) grids

Distance to commercial citrus groves
(an additional survey selection criteria)
used to intensity survey near commercial citrus

Mitigation and Disease Management

- *Plant thermotherapy to control disease.*
Exposure to 20-42C for 7-10 days significantly reduced cLas titer in potted diseased citrus.
- cLas titers were significantly reduced
 - In dooryard trees
 - In commercial-use trees in the field, however titers increased again over time
 - Commercial citrus tented in May-June in Florida exhibited greater flushing with lower cLas titers

Mitigation and Disease Management

- Citrus Health Mgmt. Areas
 - Area-wide control of ACP
 - Foliar application of broad-spectrum insecticides are applied during fall and spring to target over-wintering adult ACP
 - Applications are coordinated over a wide area

A screenshot of the University of Florida website's Citrus Health Management Areas (CHMA) page. The page has an orange header with the University of Florida logo and navigation links: Home, About Extension, Local Offices, FAQ, Success Stories, Jobs, Weather, and a search bar. Below the header is a banner with four images: a yellow airplane, a white truck spraying, a tractor, and a helicopter. The main content area is titled "Citrus Health Management Areas (CHMAs)" and lists "Active CHMA Websites" categorized by region: Volusia, Seminole, Lake, Orange, Brevard, Osceola, and Marion counties; Pasco, Hernando, and Citrus counties; and Polk, Hillsborough counties. Each category includes a small map of Florida with the relevant counties highlighted and a list of specific CHMA names. On the right side, there are sections for "Related Sites" (Citrus Health Management Areas) and "Resources" (Florida Citrus Pest Management Guide, Citrus Greening Disease, Citrus Black Spot, Citrus Health Management Areas (CHMAs), Citrus Canker, Asian Citrus Psyllid, Pesticide Information). A "< CHMA Home" link is at the bottom right.

Mitigation and Disease Management

- *RNA interference studies* passed to ACP by feeding indicate this technology can induce mortality in the absence of traditionally-known insecticide applications
- dsRNA added to artificial ACP diet at lower concentrations than previously published was effective at killing insects.

Ramos, J et al., 2013. RNA interference screening reveals redox processes to be responsive to low dsRNA doses in ACP. IRCHLB Poster. 4-7 Feb. 2013, Orlando, FL.

Mitigation and Disease Management

- Metalized mulch
 - significantly reduced ACP populations compared to a non-mulch control and a white-faced polyethylene mulch treatment
 - Increased soil moisture
 - Reduced weed pressure
 - Increased tree growth rate
 - Additional costs may be offset by increased tree vigor/production

Croxtan, S. and Stansly, P. 2013. Metalized polyethylene mulch to reduce incidence of HLB and improve growth of new citrus plantings. IRCHLB Poster. 4-7 Feb. 2013, Orlando, FL.
