

NOAA TECHNICAL MEMORANDUM NWS NHC 42

ANNUAL DATA AND VERIFICATION TABULATION
ATLANTIC TROPICAL CYCLONES 1988

Gilbert B. Clark and Robert A. Case, NHC
Miami, Fl.

National Hurricane Center
Miami, Florida
March, 1989

INTRODUCTION

This is the Fifteenth report of an annual series prepared by the National Hurricane Center (NHC) to provide a source of summarized data on Atlantic tropical cyclones. It will not duplicate the narrative overview of the hurricane season or the description of individual storms, which will continue to be published in the Monthly Weather Review. In addition to data supplied by the National Weather Service, materials have been furnished by the NOAA Tropical Satellite and Analysis Center of NHC, and the CARCAH (Chief Aerial Reconnaissance Coordination, all Hurricanes). This report also includes Probability Forecasts issued with advisories on landfalling United States tropical storms and hurricanes (Table 9).

OBJECTIVE FORECAST TECHNIQUES

The following tropical cyclone prediction models were used at the National Hurricane Center for forecasting motion on an operational basis:

1. SANBAR (Sanders and Burpee, 1968). A filtered barotropic model using input data derived from the 1000 to 100 mb pressure weighted winds. The model requires use of "bogus" data in data-void areas. The system was modified by Pike (1972) so that the initial wind field near the storm would conform to the current storm motion.
2. HURRAN (Hope and Neumann, 1970). An analog system using as a data base the tracks of all Atlantic tropical storms and hurricanes dating back to 1886.
3. CLIPER (Neumann, 1972). Stepwise multiple screening regression using the predictors derived from climatology and persistence.
4. NMC QLM MODEL (Mathur 1988). Beginning with the 1988 hurricane season, the quasi-Lagrangian model (QLM) replaced the NMC's operational hurricane prediction model. The MFM was developed in the early 1970's, well before NMC acquired the Cyber 205 computer. This advanced computer allowed higher resolution computational grids and more sophisticated procedures for parameterizing sub-grid scale physical processes to be used operationally. A new operational hurricane model was developed (i.e., the QLM) based largely on the model described by Mathur. The QLM is flexible; it can be integrated with any reasonable horizontal and vertical resolution over any limited area domain. Further, its easy to incorporate new physical parameterization procedures into the model.

5. NHC-83 MODEL (Neumann, 1983). NHC-83 is a Statistical-Dynamical model. That is, it uses the output from a numerical model but in a statistical prediction framework. Some features of the NHC-83 model are: "perfect prog" through 84 hours, deep-layer-mean height fields, avoidance of predictors in deep tropics, graphical output and forecasts available to meet advisory deadlines.
6. BAM is the Beta and Advection Model and is a modification of the Pocket Hurricane Model (Holland, 1983). Tropical cyclone motion is determined by the application of a barotropic vorticity equation on a beta plane to large-scale flow fields taken from NMC analyses and primitive equation model forecasts.

In addition, operational forecasts of tropical cyclone intensity changes in knots at 12-hourly intervals out to 72 hours are generated by a program named SHIFOR (Statistical Hurricane Intensity Forecasts). Generation of the forecast equations was done by multiple screening regression technique using historical tropical cyclone data as input. Results over the past several years have shown that SHIFOR and official intensity forecasts have comparable skill scores.

The National Hurricane Center uses the above models as guidance in the formulation of its forecasts. The hurricane forecaster also makes extensive use of analysis and prognoses produced by NMC and TSAC (Tropical Satellite and Analysis Center) in Miami.

VERIFICATION

Verification statistics for the 1988 season are shown in Table 1. The initial position error in Table 1 is the difference between the operational initial position and that determined during post analysis (best track position). The forecast displacement error is the vector difference between the forecast displacement and the actual displacement computed from the best-track positions. Landfall prediction errors for the official forecasts are given in Table 2a and 2b. These are defined as the distance from the predicted landfall point, made 24 hours prior to actual landfall, to the actual landfall point. In cases where a storm either crossed an island or made landfall when predicted to remain offshore, the error was designated from the landfall point to the nearest point on the forecast track.

Tropical cyclone warning lead times for the United States landfalling storms are given in Table 3a. A summary of the warning lead times 1970-1988 for hurricanes only and for both tropical storms and hurricanes is given in Table 3b. The length of time between the issuance of the warnings and the time that the center crossed the coast, as determined from the "best track", was taken as the warning lead time. A more complete discussion of the verification of tropical cyclone warning lead times can be found in the 1977 Annual Data and Verification Tabulation (Lawrence, Herbert and Staff, 1979).

DATA SUMMARIES

A summary of the 1988 North Atlantic tropical cyclone statistics is given in Table 4. Tracks of the 1988 storms and hurricanes are shown in figure 1.

The best track, initial, and forecast positions for the 1988 systems are in Table 5, along with initial position and forecast errors, and average errors.

Table 6 lists all center fix positions and intensity evaluations used operationally at the National Hurricane Center during the 1988 season. Fixes are in chronological order, and include those obtained by aerial reconnaissance penetrations, satellite (Miami TSAC), and land-based radar. The legend precedes the initial table.

Supplementary Vortex Data Messages are given in Table 7. A diagram of the paths flown in obtaining these Data Messages is given in Figure 2. The symbolic code for interpreting the Data Messages is given in Appendix A.

Table 8 is an aerial reconnaissance summary for the 1988 season.

Graphs of the lowest central pressure versus time for the 1988 named tropical cyclones are shown in Figure 4.

Table 9 gives the probability forecasts issued for the 1988 land-falling United States storms and hurricanes.

ACKNOWLEDGEMENTS

Main contributors were Miles Lawrence, who computed the verification statistics and Joan David, who drafted the track chart and pressure/time graphs. Brian Maher assisted in preparing the satellite pictures and Brian Petrovich the Supplementary Vortex Data Messages.

Track model forecast errors (average in nautical miles), Atlantic, 1988

Table 2a. Landfall prediction errors for 1988 tropical storms and hurricanes.

Following is a list of landfall prediction errors for tropical storms and hurricanes during 1988. Each error represents the distance (in nautical miles) from the predicted landfall point determined from the "Official" forecast issued 24 hours prior to the actual landfall point determined from the Best Track. Only tropical storms and hurricanes are included. In some cases the storm crossed an island when predicted to pass offshore. In such cases the perpendicular distance from the landfall point to the forecast track is taken as the landfall prediction error.

Storm Name	Category at Landfall	Date/Time (Z) of Landfall	Landfall Forecast Error (n.m.)	Location and remarks
ALBERTO	Tropical Storm	8/7/2200Z	75	Near Yarmouth, NS
BERYL	Tropical Storm	8/9/1200Z	75	Lake Borgne, LA
CHRIS	Tropical Storm	8/28/1500Z	200	Savannah, GA
DEBBY	Hurricane	8/31/0000Z	30	Tuxpan, MX

LEGEND FOR TABLE 6

OBSERVATIONAL UNIT

Reconnaissance

AF = Air Force

NOAA = National Oceanographic and Atmospheric Administration

Satellite

GOES-7 = Geostationary Operational Environmental Satellite

DMSP-6 = Defense Meteorological Satellite Program (AF)

NOAA-9 = NOAA Polar Orbiting Satellite

Radar

National Weather Service Radar:

ERO-R = Brownsville, TX.

SIL-R = Slidell, LA.

BTR-R = Baton Rouge, LA.

MOB-R = Mobile, AL.

NPA-R = Pensacola, FL.

TBW-R = Tampa, FL.

DAB-R = Daytona Beach, FL.

AYS-R = Waycross, GA.

CHS-R = Charleston, SC.

RESOLUTION

Reconnaissance

Navigational Accuracy/Meteorological Accuracy (NM). (Example 5/5).

Satellite

Classification confidence*, location and confidence**, visible or infrared resolution (km).

- * 1 =completely certain as to current intensity number used.
- 2 =tends to vary up and down by 1/2 T or S number.
- 3 =might vary up or down by one T or S number, or more.

- **1 =well defined eye with certain picture registration.
- 2 =well defined eye with uncertain picture registration.
- 3 =well defined circulation center with certain picture registration.
- 4 =well defined circulation center with uncertain picture registration.
- 5 =poorly defined circulation center with certain picture registration.
- 6 =poorly defined circulation center with uncertain picture registration.

(Example-1,1, Vsbl,1 = classification confidence 1, location confidence 1, visible picture with 1 kilometer resolution.)

(Example-2,5, IR 8 = classification confidence 2, location confidence 5, infrared picture with 8 kilometer resolution.)
