

Keeping the universe connected.

GNSS Space Service Volume Update—ICG Providers Forum

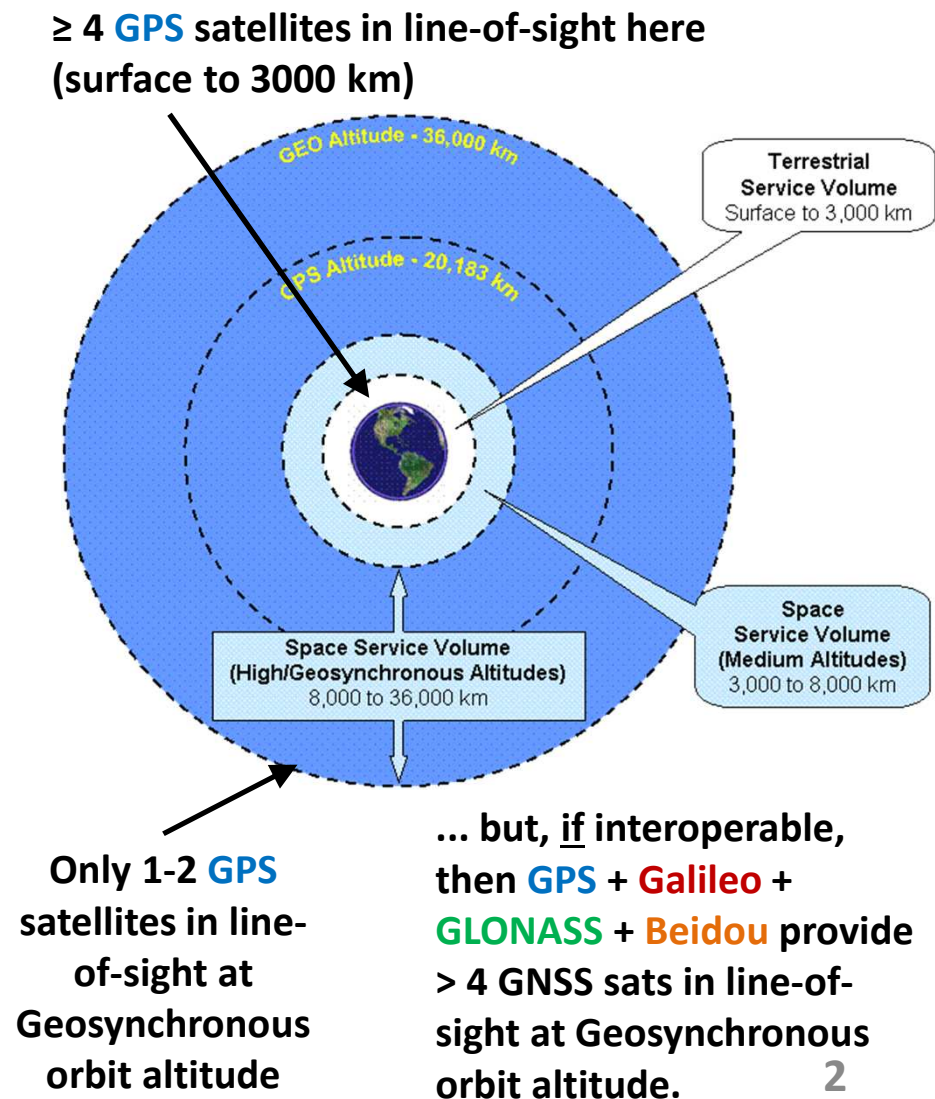

*Frank H. Bauer, Emergent Space Technologies for SCaN Program
Human Exploration and Operations Mission Directorate (HEOMD), NASA
ICG-8, Dubai, UAE, November 10, 2013*

Expanding the GPS Space Service Volume (SSV) into a multi-GNSS SSV

- At least four GNSS satellites in line-of-sight are needed for on-board real-time autonomous navigation
 - GPS currently provides this up to 3,000 km altitude
 - Enables better than 1-meter position accuracy in real-time
- At Geosynchronous altitude, only one GPS satellite will be available at any given time.
 - **GPS-only** positioning still possible with on-board filtering, but only up to approx. 100-meter absolute position accuracy.
 - **GPS + Galileo** combined would enable 2-3 GNSS sats in-view at all times.
 - **GPS + Galileo + GLONASS** would enable at least 4 GNSS sats in-view at all times.
 - **GPS + Galileo + GLONASS + Beidou** would enable > 4 GNSS sats in view at all times. This provides best accuracy and, also, on-board integrity.
- However, this requires:
 - Interoperability among these the GNSS constellations; and
 - Common definitions/specifications for use of GNSS signals within the Space Service Volume (3,000 km to Geosynchronous altitude)

Why is an interoperable Space Service Volume important?

Global, interoperable Space Service Volume specifications are crucial for real-time GNSS navigation solutions in high Earth orbit

- Supports increased satellite autonomy for high Earth orbit missions, lowering mission operations costs
- Enables new/enhanced mission capabilities for High Earth orbit and geostationary orbit missions of the future, such as:

Improved Weather Prediction using Advanced Weather Satellites

Space Weather Observations

Astrophysics Observations

En-route Lunar Navigation Support

Formation Flying & Constellation Missions

Closer Spacing of Satellites in Geostationary Arc

Current U.S. Missions using GPS above the GPS Constellation

GOES-R Weather Satellite Series

- First operational use of GPS above the constellation
- Improves navigation performance for GOES-R
- Station-keeping operations on current GOES N-Q constellation require relaxation of Image Navigation Registration for several hours
- GPS supports GOES-R breaking large station-keeping maneuvers into smaller, more frequent ones
 - Quicker Recovery
 - Minimal impact on weather science

Magnetospheric Multi-Scale (MMS) Mission

- Four spacecraft form a tetrahedron near apogee for performing magnetospheric science measurements (space weather)
- Four spacecraft in highly eccentric orbits
 - Starts in 1.2 x 12 Re orbit (7600 km x 76,000 km)
- GPS enables onboard (autonomous) navigation and potentially autonomous station-keeping

GNSS Space Service Volume Templates

- GNSS space user performance templates have been distributed to the ICG WG-B and to the Interagency Operational Advisory Group (IOAG), these include
 - A list of space missions using GNSS for navigation and/or science applications
 - Performance characteristics for the Terrestrial Service Volume (surface to 3000 km altitude)
 - Performance characteristics for the Space Service Volume (3000 km to geosynchronous altitude)

No.	Mission/Program	GNSS/s Used	Orbit	Application/s	Notes	Time Frame
1						
2						
3						
4						
5						

Terrestrial Service Volume				
Definitions		Notes		
Terrestrial Service Volume: Surface to 3,000		Position and time derived from at least 4 GNSS satellites		
Mission Type	3D Position	3D Velocity	Attitude Determination	Time

Space Service Volume			
Definitions		Notes	
Lower Space Service Volume (also known as 'MEO altitudes'): 3,000 to 8,000 km altitude		Four GPS signals available simultaneously; a majority of the time but GNSS signals over the limb of the Earth become increasingly important.	
Upper Space Service Volume (also known as 'HEO/GEO altitudes'): 8,000 to 36,000 km altitude		Nearly all GPS signals received over the limb of the Earth. Users will experience periods when no GPS satellites are available.	
Parameters		Value	
User Range Error			
Minimum Received Civilian Signal Power		Reference Half-Beamwidth	
Signal Availability			
Lower Space Service Volume (MEO)		At least 1 signal	4 or more signals
Upper Space Service Volume (HEO/GEO)		At least 1 signal	4 or more signals
Geometry			

Realizing the Space Service Volume Vision

The LONG and Winding Road

- Mid-1990s—efforts started to develop a formal Space Service Volume (SSV) with accompanying GPS signal and availability specification
- February 2000—GPS Operational Requirements Document (ORD), released, included first space user requirements and description of SSV
- 1997-Present—Several space flight experiments, particularly the AMSAT-OSCAR-40 experiment, provided data to enhance space user requirements and SSV
- 2000-2010—NASA/DoD team coordinated set of updated Space User requirements to meet existing and future PNT needs
 - Team worked with SMC/GPE, Aerospace support staff and AFSPACE to assess impacts of proposed requirements to GPS-III and to incorporate appropriate language into GPS-III Capabilities Description Document (CDD)
 - Threshold requirements correspond to performance from current constellation (do no harm to space users)
 - Future space user needs included as Objective requirements
 - Continual Joint Program Office “zero impact” push back on CDD levels to GPS-III baseline (Objective requirements)
 - Agreed to perform NASA/DoD study further as constellation design matures with emphasis on moving towards Objective requirements
 - Government System Spec (SS-SYS-800) includes CDD threshold & objective performance

Acknowledgements

- Sincere thanks to all in the U.S. that have helped realize the Space Service Volume vision:
 - USAF SMC GPS Program Office
 - NASA
 - Frank Bauer
 - Stephan Esterhuizen
 - Dale Force
 - John Rush
 - Jules McNeff
 - James Miller
 - Mike Moreau
 - A.J. Oria
 - Scott Pace
 - Park Temple
 - Larry Young
- Acknowledging, in advance, all outside the U.S. that recognize the in-space advantages of the Space Service Volume specification and provide leadership in developing a Space Service Volume specification for their GNSS constellation

Backups

Specifications (1): Received Signal Power

Signal	Terrestrial Minimum Power (dBW)	SSV Minimum Power (dBW)*	Reference Half-beamwidth
L1 C/A	-158.5	-184.0	23.5
L1C	-157.0	-182.5	23.5
L2C	-158.5	-183.0	26
L5	-157.0	-182.0	26

(*) SSV Minimum power from a 0 dBiC antenna at GEO

- SSV minimum power levels were specified based on the worst-case (minimum) gain across the Block IIA, IIR, IIR-M, and IIF satellites
- Some signals have several dB margin with respect to these specifications at reference off-nadir point

Specifications (2): Pseudorange Accuracy

- In the Terrestrial Service Volume, a position accuracy is specified. In the Space Service Volume, pseudorange accuracy is specified.
- Position accuracy within the space service volume is dependent on many mission specific factors, which are unique to this class of user, such as user spacecraft orbit, CONOPS, navigation algorithm, and User Equipment.
- Specification: The space service volume pseudorange accuracy shall be ≤ 0.8 m (rms) (**Threshold**); and ≤ 0.2 m (rms) (**Objective**).
- In order for GPS to meet the SSV accuracy requirement, additional data must be provided to users:
 - The group delay differential parameters for the radiated signal with respect to the Earth Coverage

Specifications (3): Signal Availability

- Assuming a nominal, optimized GPS constellation and no GPS spacecraft failures, signal availability at 95% of the areas at a specific altitude within the specified SSV should be as follows:

	MEO SSV		HEO/GEO SSV	
	at least 1 signal	4 or more signals	at least 1 signal	4 or more signals
L1	100%	$\geq 97\%$	$\geq 80\%$ ₁	$\geq 1\%$
L2, L5	100%	100%	$\geq 92\%$ ₂	$\geq 6.5\%$
1. With less than 108 minutes of continuous outage time. 2. With less than 84 minutes of continuous outage time.				

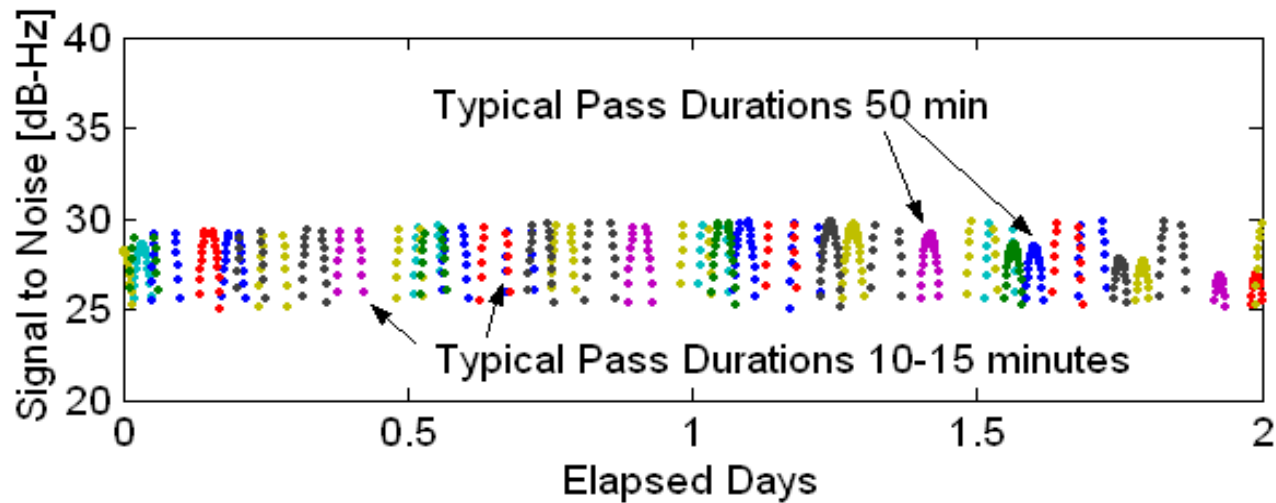

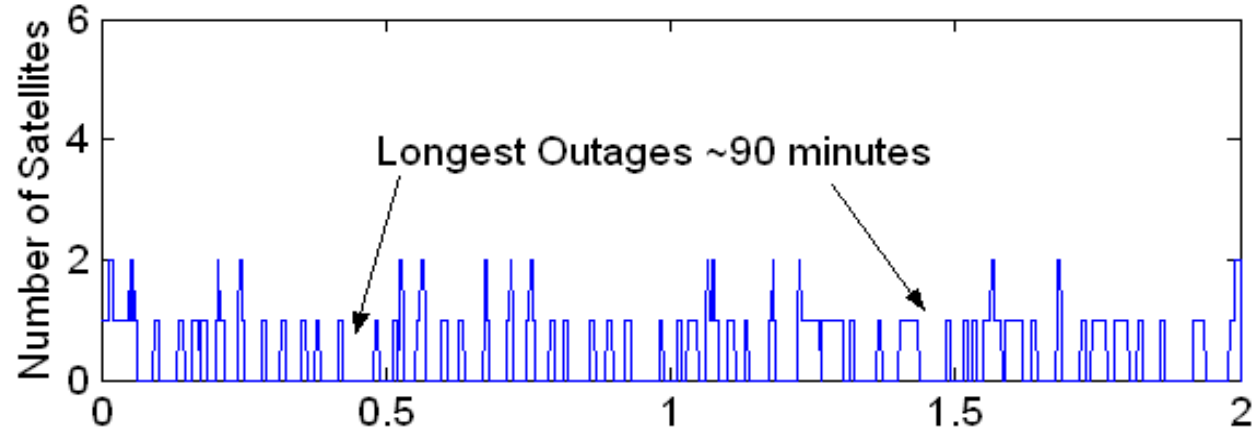

- Objective:
 - MEO SSV: 4 GPS satellites always in view
 - HEO/GEO SSV: at least 1 GPS satellite always in view

Signals Present for 25 dB-Hz Sensitivity GPS Receiver at Moon

Receiver at Moon: 25 dB-Hz Sensitivity and 10 dB Receiving Antenna

GPS Use in Cislunar Space

- Weak GPS signal tracking technology enables tracking signals up to approximately $\frac{1}{2}$ the distance to the Moon
- For example, a spacecraft returning from the Moon could start using GPS data 16 hours before Earth Insertion (EI) for trajectory determination
