

# Northeast Arizona Snow Study

NWS Flagstaff

# Introduction

- Better understand and forecast significant weather events across NE Arizona
- Study Significant Snow Storm Events
- Examine the potential of using data other than radar to determine heavy rain/snow

# Data

- xmACIS2 surface observations
- The NCEP/NCAR Upper Air Reanalysis (1948-present)
- Earth System Research Laboratory – Daily Mean Composite page
- <http://www.esrl.noaa.gov/psd/data/composites/day>
- <http://www.esrl.noaa.gov/psd/data/composites/day/datasets.html>

# Methodology

- Choose locations with a decent historical record (Canyon de Chelly, Ganado, Keams Canyon, Navajo N.M., Page, Teec Nos Pos, Window Rock)
- Select the top 20 daily snowfall events occurring during or after 1948
- Create mean charts for the top 10 then the next 10 events (500mb height, 700/500/250 mb wind, 700 mb RH, PW, Omega 500/250 mb Temp)
- Identify any significant features of all charts
- Identify differences between top 10/next 10 charts

# Results

- Mean 500 mb Heights
- Mean 700 mb Wind
- PW Anomalies
- 500/250 mb Wind Comparisons
- 500/250 mb Jet Max Speeds
- 500/250 mb Wind Speed Gradient
- 700 mb RH
- Upward Motion
- Comparison to previous study

# Summary

- Strong northerly wind anomaly at 700 m over the Pacific Ocean just off the west coast several days in advance.
- PW generally at or above the 30 year mean 1 to 2 days in advance of the storm. Essentially never below normal.
- 700 mb RH 65% to 75% percent 1 to 2 days in advance of storm.
- 500/250 jet max vertically stacked to the south to southeast of NE Arizona for >18 hours.
- 500/250 wind speed gradient centered over Arizona >18 hours
- Tend to be in the rear entrance region of a well established and quasi stationary 250 mb jet extending well downstream.
- 500/250 mb jet max rotates around bottom if existing trough
- Up/Down couplet center to center consistently about 700 miles.

# Future

- Look at common dates
- Look at analog days over a 10 year period to determine false alarm rate.
