U. S. GOVERNMENT PRINTING OFFICE : 1956 O - 408170

PREFACE

These normals are based on records for the thirty-year period 1921 to 1950, inclusive.

Where a station had a record for the entire 30 years from the same instrument site, monthly precipitation normals are the mean of the monthly values for the 30 years. For such stations, the temperature normals were obtained in a similar manner, using normal maximum and normal minimum values to obtain monthly normals. The annual normal temperature is obtained by dividing the sum of the annual normal maximum value and the annual normal minimum value for temperature by two.

For stations that did not have continuous records from the same instrument site for the entire 30 years, 1921-1950, the means have been adjusted to the record at the present site. In these adjustments, a "difference factor" was used for temperature and a "ratio factor" for precipitation. These factors were determined by parallel comparison, either between records at the actual station sites or through a second station that had a continuous record to compare against both sites for obtaining the resultant adjusting factors. Normals were thereafter obtained as outlined above.

The degree day normals shown herein are derived from the values for the monthly normal maximum and minimum temperature, and are computed on the standard base of 65°F. The seasonal total is equivalent to the annual total. Monthly normals of less than 5 degree days are shown as zero.

This system of normals departs from those previously used in three respects: (a) The 30-year period (1921-1950) adopted for the computations is consistent with the term of years accepted by the World Meteorological Organization for climatic normals. (b) Painstaking effort has been made to secure values that avoid artificial smoothing of the curves of monthly and seasonal march of the data; where the station and exposure for records in a given locality have been changed, the whole record has been carefully studied and adjusted to the latest source of records and reports. (c) For the first time, the normals for maximum and minimum temperatures are separately tabulated and made available.

NOTES:

1. Station Names

* indicates WB office closed or recently moved a significant distance. At a few such stations a cooperative or synoptic reporting station continues the record from the same instrument site.

The elevation above sea level and height of thermometers above ground with station name are the base to which normals were computed during 1951-1952 excepting new stations or certain station changes since 1952.

In the following tables "AP" after the city name indicates "airport station"; "CO" indicates "city office station". "Coop" indicates a Weather Bureau cooperative network or independent agency station.

G indicates ground elevation in feet above sea level at the station.

T indicates thermometer height above the ground at the station.

2. Table Content

T in the data tables indicates a monthly precipitation amount of only a trace.

February monthly normals are for a 28-day month.

NOTE: These data were previously issued under the same title but as a separate, not in the Technical Paper series.
