

June 2023 Climate Summary for West Central and Southwest Florida

Temperatures this June averaged slightly below normal to a little above normal across the region as upper level troughing was over the area for most of the month with no real big extremes in temperatures. However, during the last few days of the month the trough weakened with ridging building in aloft which brought some drier air along with near record high temperatures. In fact, thanks to this late month warm up a few locations ended up in the Top Ten Warmest Junes.

As for rainfall, it was not a typical June where we see our rainy season get underway with east to southeast flow around the Bermuda High. For most of the month we had upper level troughing over the eastern U.S. holding the ridge axis south of the area which kept a persistent southwest to west flow across the region. We saw rounds of thunderstorms move in from the Gulf of Mexico on different days, dumping locally heavy rainfall in some locations, especially across Levy County. However, on many days the region remained mostly dry with the showers and thunderstorms mainly over the eastern half of the Florida peninsula. Therefore, rainfall amounts varied from well below normal along parts of the west coast to well above normal over the southern interior and northern Nature Coast.
