THE CALCOFI ATLAS SERIES

This is the eighth in a series of atlases containing data on the hydrography and plankton from the region of the California Current. The field work was carried out by the California Cooperative Oceanic Fisheries Investigations,¹ a program sponsored by the State of California under the direction of the State's Marine Research Committee. The cooperating agencies in the program are:

California Academy of Sciences
California Department of Fish and Game
Stanford University, Hopkins Marine Station
U. S. Fish and Wildlife Service, Bureau of Commercial Fisheries
University of California, Scripps Institution of Oceanography

CalCOFI atlases² are issued as individual units as they become available. They provide processed physical, chemical and biological measurements of the California Current region. Each number may contain one or more contributions. A general description of the CalCOFI Program with its objectives appears in the preface of Atlas No. 2.

This atlas was prepared by the Data Collection and Processing Group of the Marine Life Research Program, Scripps Institution of Oceanography.

CalCOFI Atlas Editorial Staff:

Abraham Fleminger and Hans T. Klein, Editors
John G. Wyllie, Cartographer

Atlases in this series, through June 1967, are:

- CalCOFI Atlas No. 1
Anonymous. CalCOFI atlas of 10-meter temperatures and salinities 1949 through 1959.
- CalCOFI Atlas No. 2
Fleminger, A. Distributional atlas of calanoid copepods in the California Current region, Part I.
- CalCOFI Atlas No. 3
Alvaríño, A. Distributional atlas of Chaetognatha in the California Current region.
- CalCOFI Atlas No. 4
Wyllie, J. G. Geostrophic flow of the California Current at the surface and at 200 meters.
- CalCOFI Atlas No. 5
Brinton, E. Distributional atlas of Euphausiacea (Crustacea) in the California Current region, Part I.
- CalCOFI Atlas No. 6
McGowan, J. A. Distributional atlas of pelagic molluscs in the California Current region.
- CalCOFI Atlas No. 7
Fleminger, A. Distributional atlas of calanoid copepods in the California Current region, Part II.
- CalCOFI Atlas No. 8
Bernier, L. Distributional atlas of Thaliacea in the California Current region.

¹ Usually abbreviated CalCOFI, sometimes CALCOFI or CCOFI.

² For citation this issue in the series should be referred to as CalCOFI Atlas No. 8.

Introduction

The samples studied in connection with this report were collected on regular CalCOFI cruises during the period 1949-58. Data were obtained from the following 26 cruises: 1949 (4903-4910), 1950 (5002, 5003, 5005, 5006, 5009), 1951 (5103, 5106, 5109-5111), 1952 (5203, 5206, 5209, 5210), 1954 (5403, 5404), 1958 (5804, 5806). Hydrographic data are not presented in this volume because they appear elsewhere in this series or will become available in the near future.

Only representatives of the orders Salpida and Doliolida are shown. Representatives of the Larvacea were not adequately sampled by the nets used and often were not adequately preserved for identification.

Members of the order Pyrosomida were rare in the samples examined. Large populations of Pyrosoma appeared in the CalCOFI region during 1955 and persisted through 1956, when they again became rare. It appears that Pyrosoma atlanticum with its associated subspecies is the most common species in the region. Pyrosomida represents a group which shows a remarkable amount of intergradation. Several of the subspecies and perhaps some of the species are apparently questionable. The large collections made by CalCOFI in the years 1955 and 1956 offer a unique opportunity to study this problem.

¹ This research was carried out under the Scripps Institution's Marine Life Research Program.

² Present address: Texas A. and M. University, Department of Oceanography, College of Geosciences, College Station, Texas 77843.

Methods of Collecting

The plankton nets used in the CalCOFI Program have been adequately described in a number of publications (Ahlstrom 1948; King and Demond, 1953; Fleminger, 1964). Fleminger also describes, in general, the method used in making "standard tows" between the surface and 140 meters, the practice since Cruise 5010. Before Cruise 5010, nets were towed to a "standard depth" of 70 meters. With the change in depth of tow, the distribution of some species, Doliolletta gegenbauri in particular, showed rather abrupt changes. It is not known whether the differences represent actual changes in the distribution of the species or whether the deeper tows revealed a population not previously sampled. The latter is believed the more likely explanation.

Counts

Counts of specimens were usually made with the use of an aliquot. Exceedingly large individuals were removed before an aliquot was taken. While the size of the aliquots was varied, depending on the amount of material in the sample, the aliquots usually ranged between 20 and 50%.

Aliquots were taken by adjusting the sample volume to a multiple of a milliliter in a graduated beaker. The adjusted volume usually ranged from 200 to 500 milliliters. After stirring by rapid pouring between two beakers an aliquot of 100 ml was poured off. If a particular species was very abundant, subsamples of aliquots were employed. Such subsamples were taken by treating the aliquot as a complete sample and following the procedure outlined above. The original aliquot was examined for other species.

Counts were made under a low-power microscope, generally at a magnification of 9 λ , but higher magnifications were used when necessary.

After counting, the remaining sample was scanned for rarer species which might have been absent from the aliquot. This sometimes added a few Salpida to the list. Because of their small size, however, additional Doliolida were seldom detected by this method.

Counts were adjusted to the number of individuals in the sample by simple multiplication. That number was then adjusted to 1000 m³ of water filtered by the formula $N = 1000 n/V$, where N = number of specimens/1000 m³, n = number of specimens in the sample and V = the number of m³ of water filtered by the net.

Sampling Limitations

It should be pointed out that members of Salpida and Doliolida tend to show contagious distributions which may be masked on charts by large contour intervals.

In some cases, dense patches were not adequately sampled at sea so that reliable estimates of abundance could not be made. Sometimes notes were found on net-tow log sheets, referring to salps, such as "Not full to ring."

Remarks

Since these counts were made, the species Salpa fusiformis has been subdivided into four species by Foxton (1961). Specimens from the CalCOFI region probably include S. fusiformis and S. aspera although there are specimens which do not appear to agree with any of the four species discussed by Foxton. Assuming S. aspera is a valid species, it is apparently the more common of the two in the region.

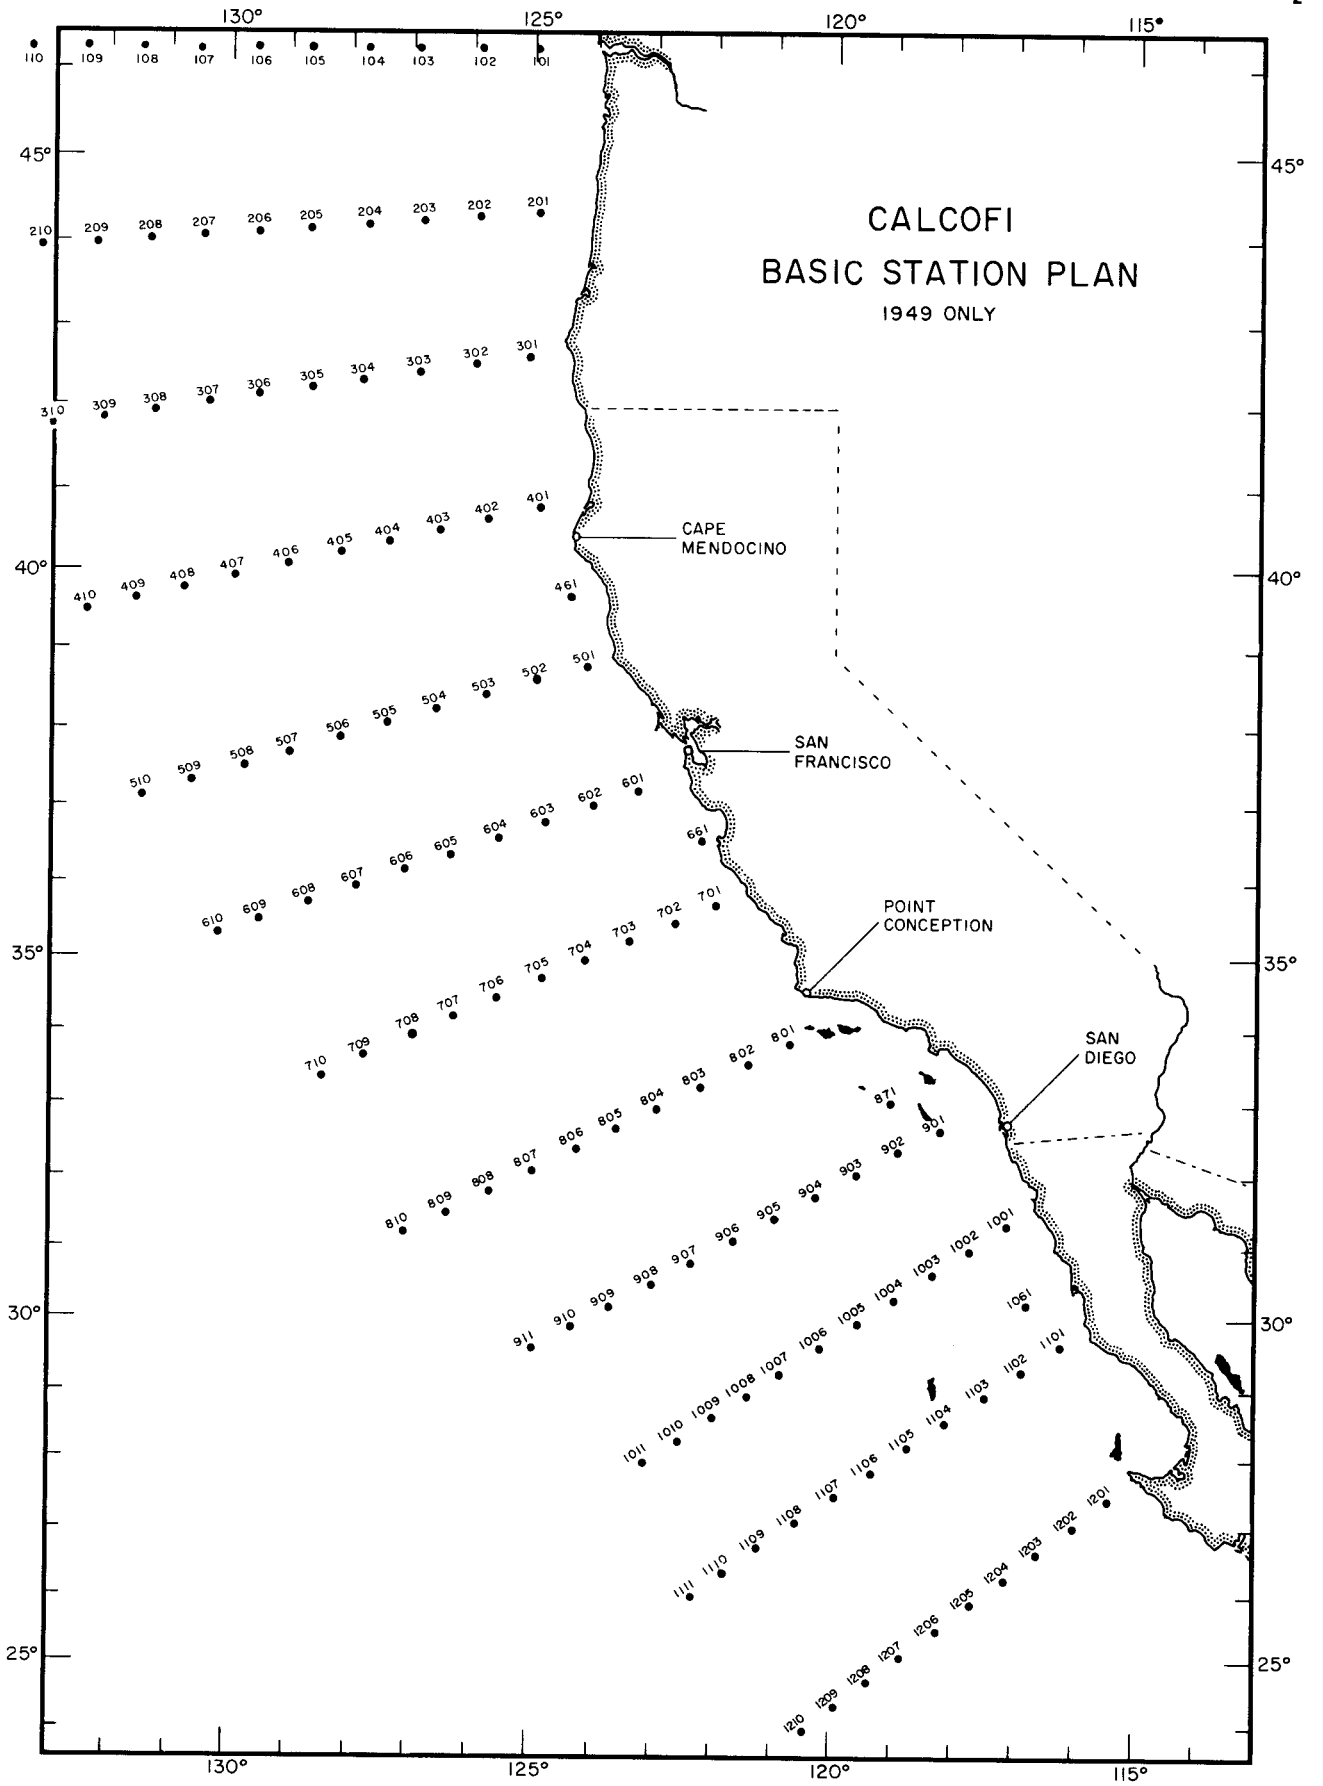

Identifications are based on the comparison of specimens with published descriptions. Four papers are particularly useful: Thompson (1945), Ritter (1906), Garstang (1933), and Yount (1954). Berner (1955) and Tokioka and Berner (1958a and b) provide descriptions of specimens not found elsewhere in the literature.

These maps are designed to show essential details of the area most intensively studied by the California Cooperative Oceanic Fisheries Investigations. This is approximately the same area as is shown in color on the front cover. Geographical place names are those most commonly used in the various publications emerging from the research. The cardinal station lines extending southwestward from the coast are shown. They are 120 miles apart. Additional lines are utilized as needed and can be as closely spaced as 12 miles apart and still have individual numbers. The stations along the lines are numbered with respect to the station 60 line, the numbers increasing to the west and decreasing to the east. Most of them are 40 miles apart, and are numbered in groups of 10. This permits adding stations as close as 4 miles apart as needed. An example of the usual identification is 120.65. This station is on line 120, 20 nautical miles southwest of station 60.

The projection of the front cover is Lambert's Azimuthal Equal Area Projection. The detail maps are a Mercator projection.
