Shoreline Mileage of the outer coast includes offshore islands, sounds, bays, rivers, and creeks to the head of tidewater or to a point where tidal waters narrow to a width of 100 feet. For the Great Lakes, shoreline mileage was measured in 1970 by the International Coordinating Committee on Great Lakes Basic Hydraulic and Hydrologic Data and cross-referenced with U.S. Lake Survey measurements for each state. In all cases, mileage was determined by using a recording device on large-scale charts.
