# Candida auris

# A drug-resistant germ that spreads in healthcare facilities

#### What is Candida auris?

The germ, Candida auris, or C. auris for short, is a fungus (also called a yeast) that can cause severe illness and spreads easily among patients in healthcare facilities. C. auris can cause a range of infections from superficial (skin) infections to more severe, life-threatening infections, such as bloodstream infections.

### What is colonization?

Patients can become colonized with *C. auris*. Colonization means people carry *C. auris* on their bodies but don't have any illness symptoms. Colonization can last for many months and even years.

## Why is C. auris a problem?

*C. auris* can spread quickly from person to person in healthcare facilities on healthcare workers' hands, healthcare equipment, and surfaces, if they are not cleaned properly. *C. auris* is hard for laboratories to identify, is often resistant to many medications used for treatment, and requires special cleaning products. *C. auris* infections can be difficult to treat and even cause death. About 30-60% of patients with invasive *C. auris* infection die.

## Who is more likely to get C. auris?

*C. auris* mainly affects patients who have long-term, serious medical problems. People who have been very sick and spent a lot of time in healthcare facilities are at the highest risk of becoming colonized with *C. auris*. Patients with invasive medical devices (breathing tubes, feeding tubes, catheters, etc.) are at higher risk for infection.

# How does C. auris spread to patients?

Patients with infection or colonization with *C. auris* can shed the germs in skin cells and in body fluids. *C. auris* can contaminate healthcare workers' hands, clothing, and other items in the healthcare environment – like doorknobs, bed rails, stethoscopes, blood pressure cuffs, and thermometers—and can quickly spread to other patients.

# How can we prevent the spread of C. auris?

To prevent spread of C. auris in healthcare facilities, healthcare workers should:

- Know how germs spread and make sure they do not carry them to other patients on their clothing, hands, or equipment.
- Wash or sanitize hands before and after caring for patients or touching items in the patient's room.
- Use the right personal protective equipment when caring for patients who can spread infections often this includes gowns and gloves.

- Use effective cleaning products for disinfecting areas that might have C. auris germs on them. The US
  Environmental Protection Agency (EPA) lists disinfectants that are effective against C. auris (see <a href="EPA">EPA</a>
  List P).
- Clean and disinfect equipment before and after use on a patient.

To prevent spread of *C. auris* in the home, you and your family should follow good general hygiene practices:

- Always clean your hands with soap and water:
  - Before preparing or eating food.
  - After using the bathroom.
  - o Before and after touching any wounds or medical devices that you may have.
- Do not share personal care items like towels and washcloths with other people.
- Cover any wounds with a bandage whenever possible.
- No special cleaning is required in your home:
  - Your clothing may be washed in the usual manner, along with the rest of the household laundry.
  - o All eating utensils and dishes can be washed the way you normally do.
- You do not need to take special precautions around your pets.

If you live with or have close contact with people who have indwelling medical devices, wounds, or a weakened immune system, please ask their primary medical provider for guidance, or call your <u>local health</u> jurisdiction.

#### Who Should Be Tested for C. auris?

Public Health recommends testing patients for *C. auris* if they may have been exposed to another person with *C. auris* infection or colonization. The testing is to see if they have the *C. auris* germ on their body.

# Should healthcare workers and family members be tested to see if they have C. auris?

Public Health does not recommend testing healthy family members or healthcare workers who care for patients with *C. auris*. In general, healthy people are not at risk from *C. auris* and do not need to be tested. However, healthcare facilities may decide to screen household contacts of patients with *C. auris* if they become ill and are admitted to a healthcare facility.
