VT AGENCY OF TRANSPORTATION PROGRAM DEVELOPMENT DIVISION HYDRAULICS UNIT

TO: Meghan Brunk, District 2 Technician

FROM: Leslie Russell, P.E., Hydraulics Project Manager

DATE: 23 December 2015

SUBJECT: Windham TH 2 (Chase Road) Culv 11 over Tannery Brook

GPS coordinates: N 43.1265° W 72.6922°

We have completed our hydraulic study for the above referenced site, and offer the following information for your use:

Hydrology

This site has a hilly drainage basin. It is mostly forested with a couple small ponds. The total contributing drainage area is about 0.4 sq. mi. The stream slope at the site was estimated to be about 1 - 2%. Using several hydrologic methods, we selected the following design flow rates:

Annual Exceedance Probability	Flow Rate in Cubic Feet per Second
(% AEP)	(CFS)
43	35
10	70
4	100 - Local Road Design Flow
2	120
1	150 - Check flow

Channel Morphology

The channel is low to moderate gradient. There is likely some coarse sediment transport at the site. There are some designated wetlands around the structure mostly on the upstream side. Field measurements of bankfull width varied from 6' to 8' upstream to 7' to 11' downstream. The Vermont Hydraulic Geometry Relationships anticipate a bankfull width of 9' for stream channels in equilibrium at this watershed size.

Existing Conditions

The existing structure is a concrete slab bridge that is 3' wide by about 6' high that provides about 18 sq. ft. of waterway area. There is a scour hole at the inlet and a large scour pool at the outlet. The abutments are undermined.

Our calculations, field observations and measurements indicate the existing structure meets the current standards of the VTrans Hydraulic Manual. However, it does not state stream equilibrium standards for bankfull width (span length). The existing structure constricts the channel width, resulting in an increased potential for debris blockage.

This structure results in a headwater depth of 5.3' at 4% AEP and 7.3' at 1% AEP.

Replacement Recommendations

In sizing a new structure we attempt to select structures that meet both the current VTrans hydraulic standards, state environmental standards with regard to span length and opening height, and allow

BC2089 Town of Windham Page: 8 of 22

for roadway grade and other site constraints.

Based on the above considerations and the information available, we recommend any of the following structures as a replacement at this site:

- 1. A concrete box with an 8' wide by 6' high inside opening. The box invert should be buried 2'. That will result in an 8' wide by 4' high waterway opening above streambed, providing 32-sq. ft. of waterway area. Bed retention sills should be added in the bottom. Sills should be 12" high across the full width of the box. So the top of the sills will be buried 12" and not be visible. Sills should be spaced no more than 8'-0" apart throughout the structure with one sill placed at the inlet and one at the outlet. The box should be filled up to the stream bed level with stone graded to match the natural stream bed material. This structure will result in a headwater depth of 2.4' at 4% AEP and of 3.2' at 1% AEP, with no roadway overtopping up to 1% AEP.
- 2. A 103" wide by 71" high corrugated metal pipe arch, with the invert buried 2' and 12" high bed retention sills and fill added as described for the box above. That will result in an approximately 103" wide by 47" high waterway opening above streambed, providing about 27.8 sq. ft. of waterway area. This structure will result in approximate headwater depth of 2.7' at 4% AEP and of 3.8' at 1% AEP, with no roadway overtopping up to 1% AEP.
- 3. An 8' diameter corrugated pipe with the invert buried 3' and 12" high bed retention sills and fill added as described for the box above. That will result in an 8' wide by 5' high waterway opening above streambed, providing about 33.1 sq. ft. of waterway area. This structure will result in approximate headwater depth of 2.9' at 4% AEP and of 4.1' at 1% AEP, with no roadway overtopping up to 1% AEP.
- 4. Any similar structure with a minimum clear span of 8' and at least 30 q. ft. of waterway area, that fits the site conditions, could be considered. Any structure with a closed bottom should have bed retention sills and a buried invert as described above.

Prior to any further action toward implementation of any of the above recommendations, structure size and type must be confirmed, and may be modified, by the VT ANR River Management Engineer to ensure compliance with state environmental standards for stream crossing structures.

Other regulatory authorities including the US Army Corps of Engineers may have additional concerns or requirements regarding replacement of this structure.

General Comments

If a new box is installed, we recommend it have full headwalls at the inlet and outlet. The headwalls should extend at least four feet below the channel bottom, or to ledge, to act as cutoff walls and prevent undermining.

If the pipe arch or round pipe is installed, concrete headwalls should be constructed at the inlet and outlet. The headwalls may be either half height or full height. The headwalls should extend at least four feet below the channel bottom or to ledge, to prevent undermining of the structure. We recommend a minimum cover of 3' over all pipe structures. Obtaining the minimum cover of 3' should be no problem at this site. Pipe manufacturers can provide specific recommendations for minimum and maximum fill heights and required pipe thickness.

It is always desirable for a new structure of this size to have flared wingwalls at the inlet and outlet, to smoothly transition flow through the structure, and to protect the structure and roadway

BC2089 Town of Windham Page: 9 of 22

approaches from erosion. The wingwalls should match into the channel banks. Any new structure should be properly aligned with the channel, and constructed on a grade that matches the channel. A new structure should span the natural channel width.

Stone Fill, Type IV should be used to protect any disturbed channel banks or roadway slopes at the structure's inlet and outlet, up to a height of at least one-foot above the top of the opening. The stone fill should not constrict the channel or structure opening.

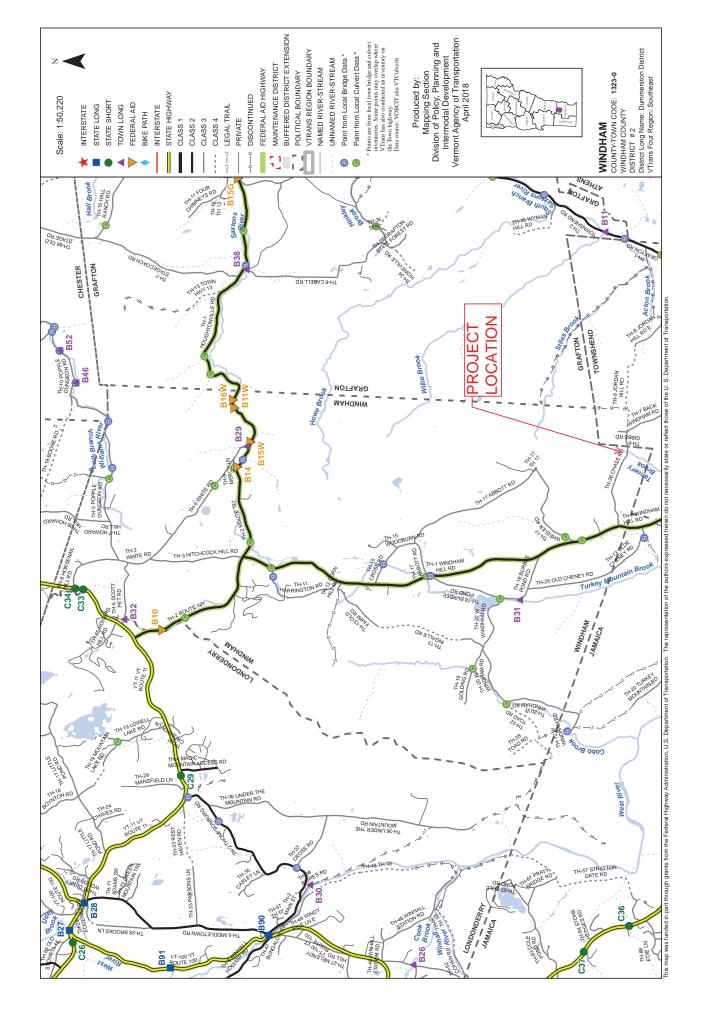

Please note that while a site visit was made, these recommendations were made without the benefit of a survey and are based on limited information. The final decision regarding replacement of this structure must comply with state regulatory standards, and should take into consideration matching natural channel conditions, roadway grade, environmental concerns, safety, and other requirements.

Please contact us if you have any questions or if we may be of further assistance.
