13 DMTF is a not-for-profit association of industry members dedicated to promoting enterprise and systems
14 management and interoperability. Members and non-members may reproduce DMTF specifications and
15 documents, provided that correct attribution is given. As DMTF specifications may be revised from time to
16 time, the particular version and release date should always be noted.

17 Implementation of certain elements of this standard or proposed standard may be subject to third party
18 patent rights, including provisional patent rights (herein "patent rights"). DMTF makes no representations
19 to users of the standard as to the existence of such rights, and is not responsible to recognize, disclose,
20 or identify any or all such third party patent right, owners or claimants, nor for any incomplete or
21 inaccurate identification or disclosure of such rights, owners or claimants. DMTF shall have no liability to
22 any party, in any manner or circumstance, under any legal theory whatsoever, for failure to recognize,
23 disclose, or identify any such third party patent rights, or for such party's reliance on the standard or
24 incorporation thereof in its product, protocols or testing procedures. DMTF shall have no liability to any
25 party implementing such standard, whether such implementation is foreseeable or not, nor to any patent
26 owner or claimant, and shall have no liability or responsibility for costs or losses incurred if a standard is
27 withdrawn or modified after publication, and shall be indemnified and held harmless by any party
28 implementing the standard from any and all claims of infringement by a patent owner for such
29 implementations.

30 For information about patents held by third-parties which have notified the DMTF that, in their opinion,
31 such patent may relate to or impact implementations of DMTF standards, visit

148

Introduction

149 The information in this specification should be sufficient for a provider or consumer of this data to identify
150 unambiguously the classes, properties, methods, and values that shall be instantiated and manipulated to
151 represent and manage the components described in this document. The target audience for this
152 specification is implementers who are writing CIM-based providers or consumers of management
153 interfaces that represent the components described in this document.

154 **Document conventions**

155 **Typographical conventions**

156 The following typographical conventions are used in this document:

- 157 • Document titles are marked in *italics*.
- 158 • Important terms that are used for the first time are marked in *italics*.

159

160

Virtual Ethernet Switch Profile

161 1 Scope

162 This profile — the *Virtual Ethernet Switch Profile* — is an autonomous DMTF management profile that
163 defines the minimum object model needed to provide for the inspection of a virtualization system's
164 internal Ethernet switch and its components.

165 2 Normative references

166 The following referenced documents are indispensable for the application of this document. For dated or
167 versioned references, only the edition cited (including any corrigenda or DMTF update versions) applies.
168 For references without a date or version, the latest published edition of the referenced document
169 (including any corrigenda or DMTF update versions) applies.

196 **3 Terms and definitions**

197 In this document, some terms have a specific meaning beyond the normal English meaning. Those terms
198 are defined in this clause.

199 The terms "shall" ("required"), "shall not," "should" ("recommended"), "should not" ("not recommended"),
200 "may," "need not" ("not required"), "can" and "cannot" in this document are to be interpreted as described
201 in [ISO/IEC Directives, Part 2](#), Annex H. The terms in parenthesis are alternatives for the preceding term,
202 for use in exceptional cases when the preceding term cannot be used for linguistic reasons. Note that
203 [ISO/IEC Directives, Part 2](#), Annex H specifies additional alternatives. Occurrences of such additional
204 alternatives shall be interpreted in their normal English meaning.

205 The terms "clause," "subclause," "paragraph," and "annex" in this document are to be interpreted as
206 described in [ISO/IEC Directives, Part 2](#), Clause 5.

207 The terms "normative" and "informative" in this document are to be interpreted as described in [ISO/IEC](#)
208 [Directives, Part 2](#), Clause 3. In this document, clauses, subclauses, or annexes labeled "(informative)" do
209 not contain normative content. Notes and examples are always informative elements.

210 The terms defined in [DSP0004](#), [DSP0200](#), and [DSP1001](#) apply to this document. The following additional
211 terms are used in this document.

212 **3.1**

213 **client**

214 an application that exploits facilities specified by this profile

215 **3.2**

216 **direct I/O**

217 a virtual system is directly connected to a non-virtualized host

218 **3.3**

219 **edge virtual bridging (EVB)**

220 a set of bridging capabilities for supporting multiple virtual computer systems with Virtual Station
221 Interfaces (VSIs), modeled as Ethernet ports. These capabilities reside in virtual Ethernet switches and
222 adjacent bridges. EVB environments differ from other 802.1Q bridge environments in that virtual Network
223 Interface Controller (vNIC) configuration information is available to the virtual Ethernet switch that is not
224 normally available to an 802.1Q bridge.

225 **3.4**

226 **embedded switch (eSwitch)**

227 a virtual Ethernet switch that is embedded in a hardware Ethernet adapter that implements either the VEB
228 or VEPA function

229 **3.5**

230 **implementation**

231 a set of CIM providers that realize the classes specified by this profile

232 **3.6**

233 **network interface controller (NIC)**

234 a NIC is a component that connects a computer system or virtual computer system to a network. It is also
235 referred to as a network adapter or adapter or Ethernet adapter in this specification.

236 **3.7**

237 **network port profile**

238 a DSP8049 compliant document that describes a set of networking attributes that can be applied to
239 Ethernet ports and virtual Ethernet switches.

240 **3.8**241 **virtual Ethernet bridge (VEB)**

242 a frame relay service that supports local bridging between multiple VSIs and (optionally) the adjacent
243 bridging environment. A VEB may be implemented in software as a vSwitch or as an eSwitch within a
244 NIC. VEBs have access to vNIC configuration information that normally is not available to an 802.1Q
245 bridge.

246 **3.9**247 **virtual Ethernet port aggregator (VEPA)**

248 a virtual Ethernet port aggregator is a capability within a computer system that collaborates with an
249 adjacent, external bridge to provide bridging support between multiple virtual computer systems and
250 external networks. The VEPA collaborates by forwarding all computer system-originated frames to the
251 adjacent bridge for frame processing and frame relay (including reflective relay forwarding) and by
252 steering and replicating frames received from the VEPA uplink to the appropriate destinations. A VEPA
253 may be implemented in software as a vSwitch or an eSwitch within a NIC. As in the case of VEBs, VEPAs
254 have access to vNIC configuration information that normally is not available to an 802.1Q bridge

255 **3.10**256 **virtual Ethernet switch**

257 an Ethernet switch that provides internal and external network connectivity to the virtual computer
258 systems attached to it. A virtual Ethernet switch implements either the VEB or VEPA function.

259 **3.11**260 **virtual network interface controller (vNIC)**

261 an entity that performs the Media Access Control (MAC), Link Level Control (LLC), management and
262 control functions needed to attach a VM to a network.

263 **3.12**264 **virtual station interface (VSI)**

265 an entity that comprises a vNIC (modeled as an Ethernet port), its internal point-to-point Ethernet
266 connection to a virtual Ethernet switch, and the Ethernet port of the virtual Ethernet switch that is
267 connected to the vNIC. Each VSI carries a single MAC service instance.

268 **3.13**269 **virtual switch**

270 a software emulated virtual Ethernet switch typically implemented within the virtualization infrastructure
271 (e.g. a Hypervisor).

272 **3.14**273 **virtualization platform**

274 the virtualizing infrastructure provided by a host system that enables the deployment of virtual systems

275 **4 Symbols and abbreviated terms**

276 The abbreviations defined in [DSP0004](#), [DSP0200](#), and [DSP1001](#) apply to this document. The following
277 additional abbreviations are used in this document.

278 **4.1**279 **CIM**

280 Common Information Model

281 **4.2**282 **CIMOM**

283 CIM object manager

284 **4.3**

313 virtual network interface controller
314 **4.13**
315 **VSI**
316 virtual station interface

317 **5 Synopsis**

318 **Profile Name:** *Virtual Ethernet Switch*

319 **Version:** 1.1.0

320 **Organization:** DMTF

321 **CIM Schema Version:** 2.30

322 **Central Class:** CIM_ComputerSystem

323 **Scoping Class:** CIM_ComputerSystem

324 This profile is an autonomous profile that defines the minimum object model needed to provide for the
325 inspection of a virtual Ethernet Switch and its components.

326 The instance of the CIM_ComputerSystem class representing a virtual Ethernet switch shall be the
327 central instance and the scoping instance of this profile.

328 Table 1 lists DMTF management profiles on which this profile depends.

329 **Table 1 – Related profiles**

Profile Name	Organization	Version	Relationship	Description
Profile Registration	DMTF	1.0	Mandatory	The profile that specifies registered profiles
Virtual System	DMTF	1.0	Specializes	The autonomous profile that specifies the minimum object model needed to define a virtual system

330 **6 Description**

331 This profile specializes the autonomous [DSP1057](#). This profile defines the minimum top-level object
332 model needed to define a virtualization system’s internal Ethernet switch (vSwitch) or a hardware
333 embedded Ethernet switch (eSwitch). The primary design objective applied by this profile is that a virtual
334 Ethernet switch and its components appear to a client as a hosted virtual system with dedicated switch
335 functionality. Typical management tasks such as enumerating, analyzing, controlling, or configuring an
336 Ethernet switch should be enabled without requiring the client to understand specific aspects of an
337 Ethernet switch.

338 **6.1 DMTF management profile relationships**

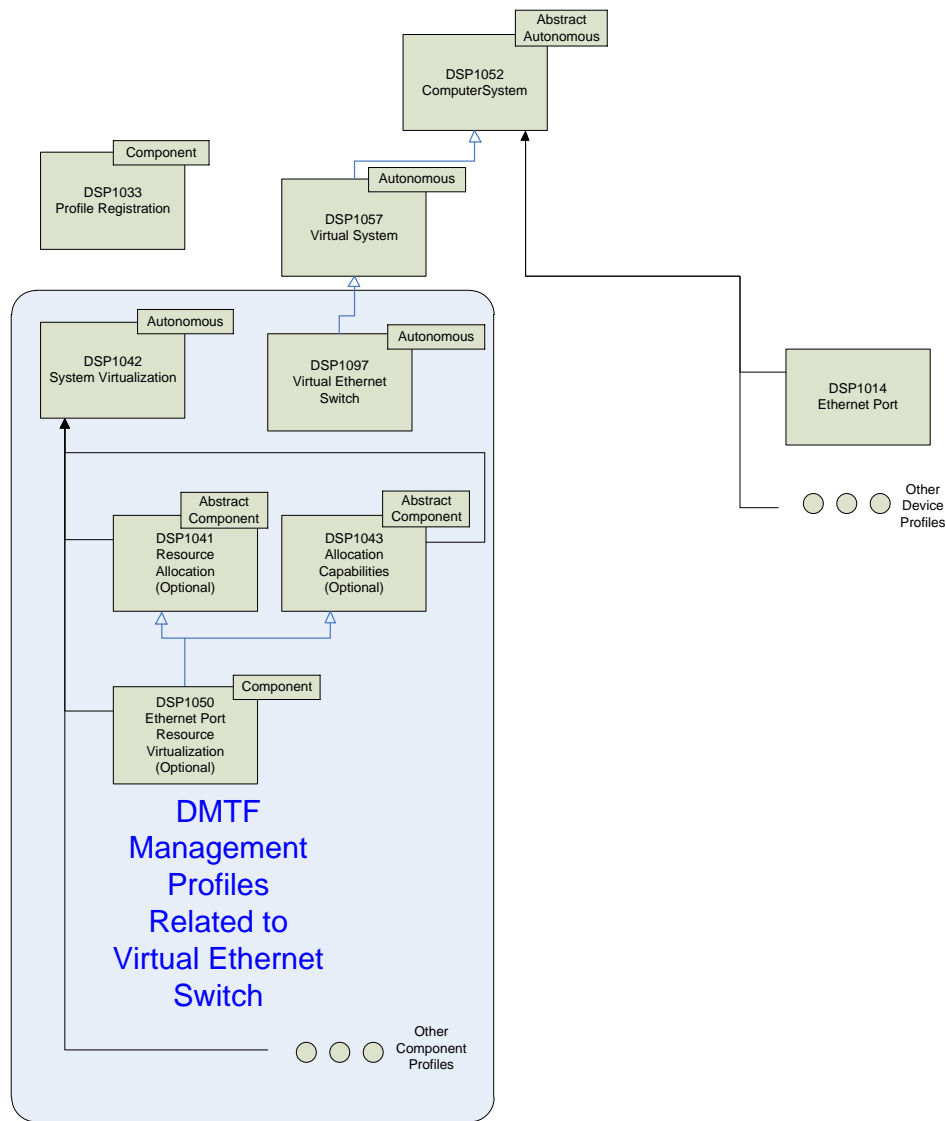

339 This profile is complementary to the [DSP1057](#), which it specializes, and to the [DSP1042](#):

- 340 • The *Virtual Ethernet Switch Profile* focuses on specializing the use of the components specified
341 in the [DSP1057](#) to model the internal Ethernet Switches that are typically used to provide
342 Ethernet connectivity within and outside of the virtualization platform.
- 343 • The [DSP1057](#) focuses on virtualization aspects that relate to virtual systems and their virtual
344 resources, such as modeling the *structure* of virtual systems and their resources. The profile
345 introduces the concept of virtual system configurations allowing the inspection of virtual system
346 configuration and state information.
- 347 • The [DSP1042](#) focuses on virtualization aspects that relate to host systems and their resources,
348 such as modeling the *relationships* between host resources and virtual resources. Further, it
349 addresses virtualization-specific tasks such as the creation or modification of virtual Ethernet
350 switches and their configurations.

351 Figure 1 shows a structure of DMTF management profiles. For example, an implementation that
352 instruments a virtualization platform may implement some of the following DMTF management profiles:

- 353 • The *Virtual Ethernet Switch Profile* enables the inspection and basic operations on a virtual
354 Ethernet Switch.
- 355 • The [DSP1057](#) enables the inspection of and basic operations on virtual systems.
- 356 • The [DSP1042](#) enables the inspection of host systems, their capabilities, and their services for
357 creation and manipulation of virtual systems, including virtual Ethernet switches.

- 358
- 359
- 360
- 361
- 362
- Resource-type-specific profiles enable the inspection and operation of resources for one particular resource type. They apply to both virtual and host resources; they do not cover virtualization-specific aspects of resources. A client may exploit resource-type-specific management profiles for the inspection and manipulation of virtual and host resources in a similar manner.
- 363
- 364
- 365
- 366
- 367
- 368
- The [DSP1050](#) is a specific resource allocation profile that enables the inspection and operation of resources for the two virtualization-specific uses of the CIM_EthernetPort class and the simple resource allocation used for the connection between an Ethernet adapter and an Ethernet switch port. This profile specializes the abstract [DSP1041](#) and the abstract [DSP1043](#) and is scoped by the [DSP1042](#). A client may exploit this resource allocation profile to inspect all of the following:
 - 369 – the allocation of virtual Ethernet adapters and virtual Ethernet switch ports
 - 370 – the connection of an Ethernet adapter (virtual or physical) to a virtual Ethernet switch port
 - 371 – the connection of a virtual Ethernet switch to a embedded Ethernet switch
 - 372 – the allocation dependencies that the virtual resources have on host resources and
 - 373 resource pools
 - 374 – the capabilities describing possible values for the resource allocations
 - 375 – the capabilities describing the mutability of the resource allocations

376

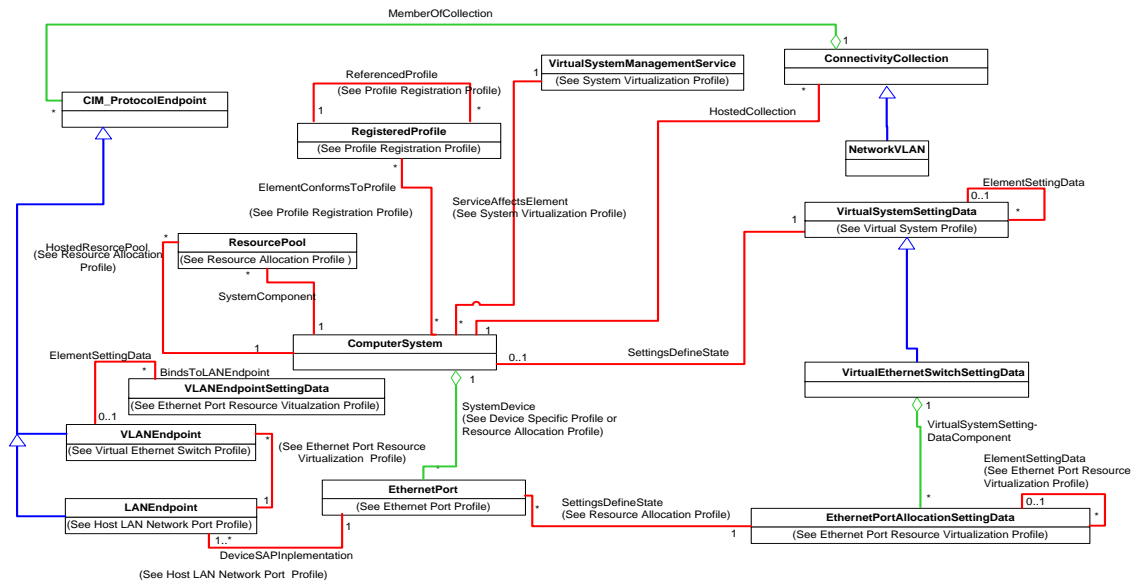

377

Figure 1 – DMTF Management profiles related to the virtual Ethernet switch

378 **6.2 Virtual Ethernet switch class schema**

379 Figure 2 shows the class schema of this profile. It outlines the elements that are owned or specialized by
 380 this profile, as well as the dependency relationships between elements of this profile and other profiles.
 381 For simplicity in diagrams, the *CIM_* prefix has been removed from class and association names.

382 The [Computer System Profile \(DSP1052\)](#) and the [Virtual System Profile \(DSP1057\)](#) reference additional
 383 classes in the class diagram that outline relationships with certain resources, services, and protocol
 384 endpoints. The *Virtual Ethernet Switch Profile* provides no specialization of these dependencies. For that
 385 reason they are not shown in the class diagram. For details, refer to the [Computer System Profile](#)
 386 ([DSP1052](#)) and to the component profiles referenced there.

387
388

389 **Figure 2 – Virtual Ethernet Switch Profile: Class Diagram**

390 This profile specifies the use of the following classes and associations:

- 391 • The CIM_ComputerSystem class represents a virtual Ethernet switch or an embedded Ethernet
392 switch.
- 393 • The CIM_RegisteredProfile class and the CIM_ElementConformsToProfile association are used
394 to model conformance with this profile.
- 395 • The CIM_NetworkVLAN class represents a collection of VLAN endpoints that are members of
396 the same VLAN.
- 397 • The CIM_LANEndpoint class represents the Ethernet communication endpoint of the
398 CIM_EthernetPort that represents an Ethernet switch port.
- 399 • The CIM_VLANEndpoint class represents an endpoint on a virtual Ethernet switch that is
400 assigned to a given VLAN or accepts traffic from one or more VLANs.
- 401 • The CIM_VLANEndPointSettingData class represents the configuration data for
402 CIM_VLANEndpoint instances.
- 403 • The CIM_ConnectivityCollection class represents a collection of LANEndpoints that are able to
404 communicate with each other.
- 405 • The CIM_VirtualEthernetSwitchSettingData class specializes the
406 CIM_VirtualSystemSettingData class to add Ethernet switch-specific aspects to a virtual
407 Ethernet switch.
- 408 • CIM_VirtualEthernetSwitchSettingData.AssociatedResourcePool contains the list of
409 associated resource pools that the resource type 33 (Ethernet Connection) use for the
410 allocation of Ethernet connections between an Ethernet Switch and a Virtual System,
411 including another instance of an Ethernet Switch.

- 412 • EVBMode describes the Ethernet virtual bridge mode that this Ethernet switch is operating
413 in. The value 2 (VEB) indicates that the EVB's associated port on the adjacent bridge is not
414 configured for Reflective Relay and the value 3 (VEPA) indicates that the associated port
415 on the adjacent bridge is configured for Reflective Relay as defined in [IEEE 802.1Qbg](#).
- 416 • VLANConnection lists the available or defined VLANs on this Ethernet switch.
- 417 • The CIM_SystemComponent association is used to model the relationship between the
418 virtualization system's host resource pool of resource type 33 (Ethernet Connection) and the
419 Virtual Ethernet Switch represented by the CIM_ComputerSystem class to which the resource
420 pool's Ethernet connections can be made. Ethernet Connection resource pools are used for the
421 allocation of a connection between an Ethernet port, that is typically part of a virtual system, and
422 an Ethernet switch port.
- 423 • The CIM_HostedCollection association is used to model the relationship of the Virtual Ethernet
424 Switch represented by the CIM_ComputerSystem class to each CIM_NetworkVLAN instance
425 that represents a VLAN available in the switch. It is also used to model the relationship of the
426 host system represented by the CIM_ComputerSystem class to each
427 CIM_ConnectivityCollection.
- 428 • The CIM_VirtualSystemSettingDataComponent association is used to model the aggregation of
429 instances of the CIM_EthernetPortAllocationSettingData class to one instance of the
430 CIM_VirtualEthernetSwitchSettingData class, forming a virtual Ethernet switch configuration.
- 431 • The CIM_VirtualSystemManagementService class contains the set of methods used to manage
432 a virtualization environment. In the context of this profile the methods support the lifecycle and
433 configuration of an Ethernet switch.
- 434 • The CIM_SettingsDefineState association is used to model the relationship between an
435 instance of the CIM_ComputerSystem class representing a virtual Ethernet Switch and an
436 instance of the CIM_VirtualEthernetSwitchSettingData class representing virtualization-specific
437 aspects of that virtual Ethernet switch.
- 438 • The CIM_ElementSettingData association is used to model the relationship between an element
439 and configuration data applicable to the element.

440 In general, any mention of a class in this document means the class itself or its subclasses. For example,
441 a statement such as "an instance of the CIM_LogicalDevice class" implies an instance of the
442 CIM_LogicalDevice class or a subclass of the CIM_LogicalDevice class.

443 6.3 Ethernet switch states and transitions

444 The *Virtual Ethernet Switch Profile* adds no specialization to the states and transitions as specified in the
445 [DSP1057](#). Unlike the [DSP1057](#) model's requirement to match a model of a physical system, the virtual
446 Ethernet switch model is solely intended for use in a virtualization system and may not have a defined
447 corresponding physical system model. Thus, the need for power and enabled state transitions are
448 minimal and most implementations will implement the minimum as described in the [DSP1057](#).

449 7 Implementation

450 This clause details the requirements related to classes and their properties for implementations of this
451 profile. The CIM Schema descriptions for any referenced element and its subelements apply.

452 The list of all methods covered by this profile is provided in clause 8. The list of all properties covered by
453 this profile is provided in clause 10.

454 In references to CIM Schema properties that enumerate values, the numeric value is normative and the
455 descriptive text following it in parenthesis is informational. For example, in the statement "If an instance of
456 the CIM_VirtualSystemManagementCapabilities class contains the value 3 (DestroySystemSupported) in

457 an element of the SynchronousMethodsSupported[] array property”, the “value 3” is normative text and
458 “(DestroySystemSupported)” is descriptive text.

459 Unless explicitly described, the text in this clause does not relax any of the implementation details
460 described in clause 7 of the [DSP1057](#).

461 **7.1 CIM_ComputerSystem**

462 The CIM_ComputerSystem class shall be used to represent virtual Ethernet switches. One instance of the
463 CIM_ComputerSystem class shall exist for each Ethernet switch that is conformant to this profile, regard-
464 less of its state.

465 This subclause and all secondary subclauses apply to instances of the CIM_ComputerSystem class that
466 represent Ethernet switches in this profile and the virtual system in the [DSP1057](#).

467 **7.1.1 CIM_ComputerSystem.Dedicated property**

468 The Dedicated property shall be supported and set to match the value 38 (Ethernet Switch).

469 **7.2 CIM_VirtualEthernetSwitchSettingData**

470 There shall be exactly one instance of CIM_VirtualEthernetSwitchSettingData that represents the “state”
471 virtual system configuration as specified in [DSP1057](#). This subclause and all secondary subclauses apply
472 to instances of the CIM_VirtualEthernetSwitchSettingData class that represent the “state” virtual system
473 configuration in this profile as specified in [DSP1057](#).

474 **7.2.1 CIM_VirtualEthernetSwitchSettingData.VirtualSystemType**

475 The VirtualSystemType property shall be supported and contain the value “DMTF:VirtualEthernet Switch”.

476 **7.2.2 CIM_VirtualEthernetSwitchSettingData.AssociatedResourcePool**

477 The AssociatedResourcePool property shall be supported if VirtualEthernetSwitchSettingData is used as
478 an instance in a virtual system configuration as specified in this profile. The property shall contain the list
479 of host resource pools that are associated with an Ethernet Switch for the purpose of the allocation of
480 Ethernet connections between a virtual machine and an Ethernet switch.

481 **7.2.3 CIM_VirtualEthernetSwitchSettingData.EVBmode**

482 The EVBmode property shall be supported if VirtualEthernetSwitchSettingData is used as an instance in
483 a virtual system configuration as specified in this profile. The property shall match one of two enumeration
484 values:

- 485 1. 2 (VEB) for a virtual Ethernet bridge configuration of a software or a hardware embedded virtual
486 Ethernet bridge
- 487 2. 3 (VEPA) for a virtual Ethernet Port aggregator configuration of a software or a hardware
488 embedded Ethernet switch

489 The use of the array VLANConnection is optional. If VirtualEthernetSwitchSettingData is used as an
490 instance in a virtual system configuration as specified in this profile, for each non-empty array element
491 contained in the CIM_VirtualEthernetSwitchSettingData.VLANConnection array a corresponding instance
492 of CIM_NetworkVLAN shall be instantiated with the CIM_NetworkVLAN.VLANID property set to the
493 corresponding value contained in the array element.

494 **7.3 CIM_NetworkVLAN**

495 Each instance of CIM_NetworkVLAN representing a VLAN on the Ethernet Switch shall be associated
496 with an instance of the CIM_HostedCollection to the instance of CIM_ComputerSystem used to represent

497 the Ethernet Switch. Each instance of CIM_NetworkVLAN representing a VLAN on the Ethernet Switch
498 shall be associated with an instance of CIM_MemberOfCollection to the instances of CIM_VLANEndpoint
499 scoped to the above described CIM_ComputerSystem, that are configured to be a member of the
500 represented VLAN. CIM_NetworkVLAN.TypeOfMedia property shall be set to the value 3 (Ethernet)

501

502 **8 Methods**

503 This profile does not define any extrinsic methods beyond those defined or referenced in the [DSP1057](#).

504 **8.1 Profile conventions for operations**

505 The implementation requirements on operations for each profile class (including associations) are
506 specified in class-specific subclauses of this clause.

507 The default list of operations for all classes is:

- 508 • GetInstance
- 509 • EnumerateInstances
- 510 • EnumerateInstanceNames
- 511 • Associators
- 512 • AssociatorNames
- 513 • References
- 514 • ReferenceNames

515 Implementation requirements on operations defined in the default list are provided in the class-specific
516 subclauses of this clause.

517 The implementation requirements for methods of classes listed in 8.1, but not addressed by a separate
518 subclause of this clause are specified by the "Methods" clauses of respective base profiles, namely
519 [DSP1041](#) and [DSP1043](#). These profiles are specialized by this profile; in these cases, this profile does
520 not add method specifications beyond those defined in its base profiles.

521 **8.1.1 CIM_ComputerSystem**

522 All operations in the default list in 8.1 shall be implemented as specified by [DSP0200](#). In addition, the
523 requirements of the CIM schema and other prerequisite specifications (including profiles) apply.

524 **8.1.2 CIM_NetworkVLAN**

525 All operations in the default list in 8.1 shall be implemented as specified by [DSP0200](#). In addition, the
526 requirements of the CIM schema and other prerequisite specifications (including profiles) apply.

527 **8.1.3 CIM_ConnectivityCollection**

528 All operations in the default list in 8.1 shall be implemented as specified by [DSP0200](#). In addition, the
529 requirements of the CIM schema and other prerequisite specifications (including profiles) apply.

530 8.1.4 CIM_ElementSettingData

531 All operations in the default list in 8.1 shall be implemented as specified by [DSP0200](#). In addition, the
532 requirements of the CIM schema and other prerequisite specifications (including profiles) apply.

533 8.1.5 CIM_HostedCollection

534 All operations in the default list in 8.1 shall be implemented as specified by [DSP0200](#). In addition, the
535 requirements of the CIM schema and other prerequisite specifications (including profiles) apply.

536 8.1.6 CIM_MemberOfCollection

537 All operations in the default list in 8.1 shall be implemented as specified by [DSP0200](#). In addition, the
538 requirements of the CIM schema and other prerequisite specifications (including profiles) apply.

539 8.1.7 CIM_RegisteredProfile

540 All operations in the default list in 8.1 shall be implemented as specified by [DSP0200](#). In addition, the
541 requirements of the CIM schema and other prerequisite specifications (including profiles) apply.

542 8.1.8 CIM_SystemComponent

543 All operations in the default list in 8.1 shall be implemented as specified by [DSP0200](#). In addition, the
544 requirements of the CIM schema and other prerequisite specifications (including profiles) apply.

545 8.1.9 CIM_VirtualEthernetSwitchSettingData

546 All operations in the default list in 8.1 shall be implemented as specified by [DSP0200](#). In addition, the
547 requirements of the CIM schema and other prerequisite specifications (including profiles) apply.

548 9 Use cases

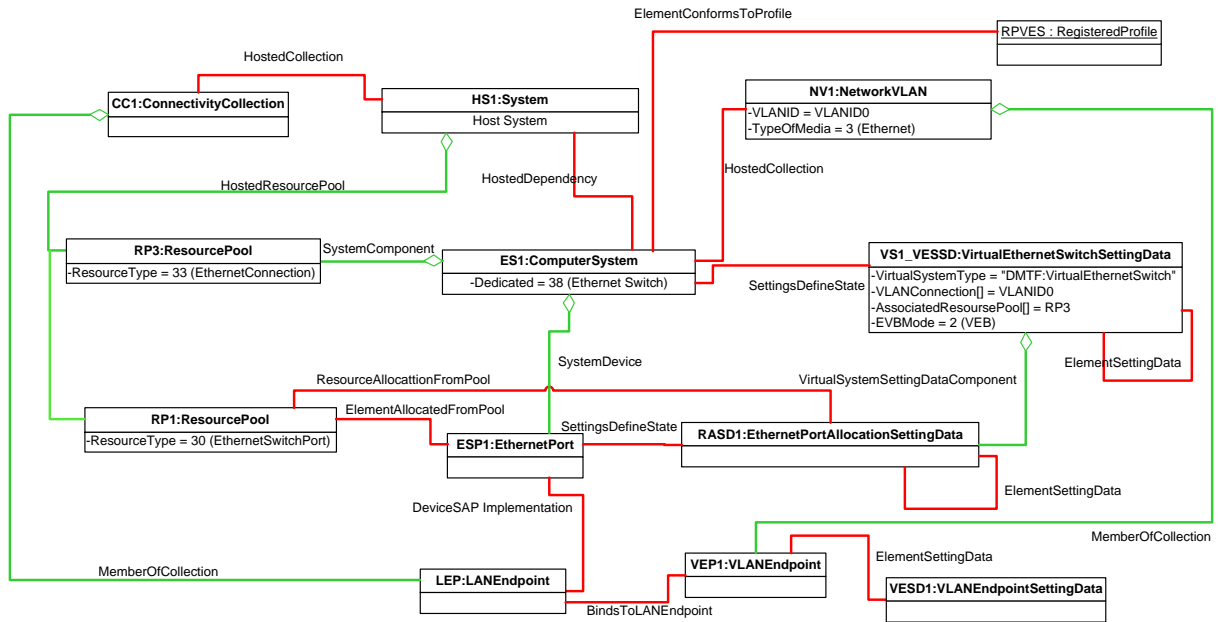

549 The following use cases and object diagrams illustrate the use of this profile. They are for informational
550 purposes only and do not introduce behavioral requirements for implementations of the profile.

551 9.1 Virtual system detection and inspection

552 The [DSP1057](#) includes a set of valid use cases that are not included in this document. This document
553 includes only those use cases that are specific to the understanding, discovery, configuration and
554 management specific to this profile's specialization of the [DSP1057](#).

555 9.1.1 Example of virtual Ethernet switch and its relationship to a virtualization 556 platform's host system

557 Figure 3 shows an example of a virtual Ethernet Switch (ES1) hosted by the virtualization platform (HS1).
558 Although the diagram is simplified, the virtual Ethernet switch as modeled is a compliant virtual system as
559 specified in the [DSP1057](#) and this profile. This example switch has one Ethernet switch port represented
560 by the instance of the CIM_EthernetPort class, ESP1. The allocation of the Ethernet switch port instance
561 was from resource pool RP1 and is a compliant Ethernet switch port allocation as specified in the
562 [DSP1050](#) and the [DSP1042](#). The Ethernet switch port is a member of the connectivity collection CC1, as
563 shown with the CIM_MemberOfCollection association between instances LEP1:LANEndpoint and
564 CC1:ConnectivityCollection. The [DSP1050](#) compliant Ethernet switch port in the example is VLAN aware,
565 as shown through the VLANEndpoint instance VEP1 and its membership in the NetworkVLAN collection
566 NV1. This Ethernet switch currently has one VLAN (VLANID0) as defined in the instance VS1 of the
567 VirtualEthernetSwitchSettingData.VLANConnection array property. ES1 is associated with one Ethernet
568 Connection resource pool, RP2, that is used for the allocation for connections between virtual machines
569 and Ethernet switch port on the associated Ethernet switch as specified in the [DSP1050](#). RP2 is
570 associated to ES1 with the SystemComponent association and configured in the instance VS1 of the
571 VirtualEthernetSwitchSettingData.AssociatedResourcePool array property. Also the switch is configured
572 or described in the EVBmode property of this instance of the class to be in Virtual Ethernet Bridge (VEB)
573 mode.

574
575

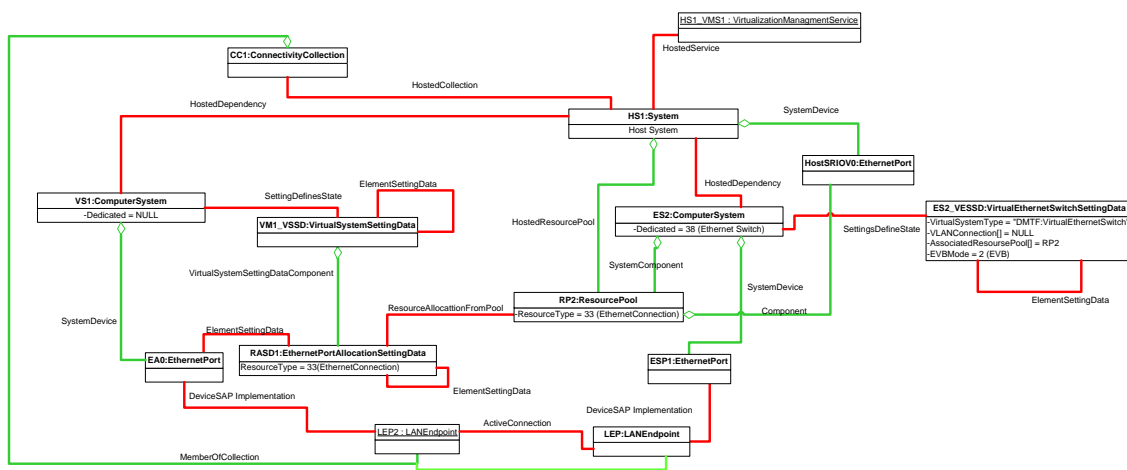

576 **Figure 3 – Basic example of virtual Ethernet switch**

577 **9.1.2 Virtual system connected to an SRIOV capable switch.**

578 Figure 4 illustrates a virtual system directly connected to an Ethernet switch port on the embedded
 579 hardware Ethernet switch. The Ethernet switch ports associated to the instance of the
 580 CIM_ComputerSystem, ES1, represent the vNICs provided by the associated host Ethernet adapter
 581 instance HostSRIOV0. A hardware embedded switch is basically modeled the same as a software virtual
 582 Ethernet switch. In Figure 4 following the component association from the Ethernet connection resource
 583 pool RP2 to the associated CIM_EthernetPort instance, HostSRIOV0, shows the host resource for the
 584 resource pool is an Ethernet adapter. Not shown in Figure 4, the uplink port for this switch would be the
 585 CIM_LANEndpoint instance associated with the host Ethernet adapter.

586 Instance EA0 represents a virtual NIC of the virtual system instance VS1. EA0 is connected to the
 587 Ethernet switch port instance ESP1. This connection was allocated out of the resource pool instance RP2
 588 as part of an Ethernet connection allocation as specified in [DSP1050](#).

589

590

591

Figure 4 – Virtual system connected to an SRIOV capable switch (Direct-I/O).

592

9.1.3 Virtual Ethernet switch connected to an embedded IOV switch.

593

Figure 5 and Figure 6 show examples of a software Ethernet Switch (VS1), hosted by the virtualization platform (HS1), connected to an IOV capable Ethernet adapter’s embedded Ethernet switch (ES2).

594

595

Figure 5 shows a software VEB that gains its network connectivity through an embedded switch that represents the network connectivity through an IOV network adapter (HostSRIOV0:EthernetPort.)

596

597

Figure 6 shows the same instance diagram with both the software Ethernet switch and the embedded hardware Ethernet switch in VEPA mode. It is important to note that if any switch in a cascade of virtual switches

598

599

are in EVBMode 3 (VEPA), all of the switches in the cascade should be in VEPA mode for proper functionality.

600

601

In the diagrams, both of the Ethernet switches are modeled as compliant virtual systems as specified in the [DSP1057](#) and this profile. In these instance diagrams, the embedded switch ES2 has one Ethernet switch port represented by the instance of the CIM_EthernetPort class ESP1. Ethernet switch ES2 has one Ethernet Connection resource pool, RP2, that is modeled as specified in the [DSP1050](#) and is associated to ES2 with the SystemComponent association. This pool is referenced in the instance ES2_VESSD:VirtualEthernetSwitchSettingData.AssociatedResourcePool array property. The EthernetPort (HostSRIOV0) representing the SRIOV capable Ethernet adapter is associated with the Ethernet connection resource pool RP2. This configuration shows that the RP2 represents the capability of the Ethernet adapter.

602

603

604

605

606

607

608

609

610

The diagrams each show an Ethernet connection allocation from the resource pool RP2 represented by the CIM_EthernetPortAllocationSettingData instance RASD1 and the CIM_ActiveConnection association between the two CIM_LANEndpoint instances LEP1 and LEP2. Also the two CIM_LANEndpoint instances are members of the connectivity collection CC1, as shown with the CIM_MemberOfCollection association between instances LEP1 and LEP2 and the CIM_ConnectivityCollection instance CC1. Both [DSP1050](#) compliant Ethernet switch ports in the examples are VLAN aware, as shown through the VLANEndpoint instances VEP1 and VEP2 and their respective memberships in the NetworkVLAN collections NV1 and NV2. Each Ethernet switch currently has one VLAN (VLANID0) as defined in the instances VS1_VESSD and ES1_VESSD of the VirtualEthernetSwitchSettingData.VLANConnection array property. Each switch has one Ethernet Connection resource pool RP2 and RP3 that are used as specified in the [DSP1050](#) and are associated to CIM_ComputerSystem instances ES2 and VES1 with the SystemComponent association as configured in instances VS1_VESSD and ES2_VESSD of the VirtualEthernetSwitchSettingData.AssociatedResourcePool array property.

611

631

632 **Figure 6 – Cascaded VEPA switch**

633 **9.1.4 Discover conformant virtual Ethernet switches using SLP**

634 This use case describes how to locate instances of the CIM_ComputerSystem class that represent virtual
 635 Ethernet Switches that are central instances of this profile (the *Virtual Ethernet Switch Profile*). This
 636 process requires two steps:

- 637 1) The service location protocol (SLP) is used to locate CIM object managers (CIMOMs) where
 638 this profile is implemented. A CIMOM using SLP facilities provides information about itself to
 639 SLP in the form of an SLP service template. The service template may contain information
 640 about the set of DMTF management profiles that is implemented at the CIMOM.
- 641 2) Normal CIM enumeration and association resolution is used to find instances of the
 642 CIM_ComputerSystem class that represent central instances of this profile.

643 **Assumption:** This profile is registered in at least one CIMOM that maintains a registration with an SLP
 644 Directory Agent; the registration includes information about registered DMTF management profiles. The
 645 client is able to make SLP calls and invoke intrinsic CIM operations.

646 A client can locate instances of the CIM_ComputerSystem class that represent virtual systems that are
 647 central instances of this profile as follows:

- 648 1) The client invokes the SLPFindSrvs() SLP function:
- 649 – The value of the srvtype parameter is set to “service:wbem”.
 - 650 – The value of the scopelist parameter is set to “default”.
 - 651 – The value of the filter parameter is set to “(RegisteredProfilesSupported=DMTF:Virtual
 652 Ethernet Switch Profile)”.
- 653 The result is a list of URLs that identify CIMOMs where this profile (the *Virtual Ethernet Switch
 654 Profile*) is implemented.
- 655 2) The client contacts each of the CIMOMs and enumerates or queries the CIM_RegisteredProfile
 656 class.
- 657 – As input, the client needs to use the address information of one server obtained in step 1)
 658 and issue the intrinsic EnumerateInstanceNames() CIM operation on the
 659 CIM_RegisteredProfile class. Alternatively, the client may issue the intrinsic ExecuteQuery
 660 CIM operation and specify a where clause that, for example, limits the value ranges for the
 661 RegisteredName and RegisteredVersion properties of the CIM_RegisteredProfile class.
 - 662 – As a result, the client receives a list of references to instances of the
 663 CIM_RegisteredProfile class that represent implementations of this profile (the *Virtual
 664 Ethernet Switch Profile*) at the intended target location. On a query operation this list is
 665 already limited according to the input selection criteria.
- 666 3) The client selects one reference and resolves the CIM_ElementConformsToProfile association
 667 from the instance of the CIM_RegisteredProfile class to instances of the CIM_ComputerSystem
 668 class.
- 669 – As input, the client needs to provide the reference to an instance of the
 670 CIM_RegisteredProfile class that was selected from the result set obtained in step 2).
 - 671 – As a result, the client receives a list of references referencing instances of the
 672 CIM_ComputerSystem class that represents virtual Ethernet switches.

673 **Result:** The result is that the client knows a set of references referencing instances of the
 674 CIM_ComputerSystem class that represent virtual Ethernet Switches that are central instances of this
 675 profile.

676 9.1.5 Locate Ethernet switches hosted by a host system

677 **Assumption:** The client knows a reference to an instance of the CIM_System class that is a central in-
 678 stance of the [DSP1042](#) and represents a host system.

- 679 • The client invokes the intrinsic AssociatorNames() CIM operation for the list of virtual systems,
 680 as follows:

- 681 – The value of the ObjectName parameter is set to refer to the instance of the CIM_System
- 682 class.
- 683 – The value of the AssocClass parameter is set to "CIM_HostedDependency".
- 684 – The value of the ResultClass parameter is set to "CIM_ComputerSystem".
- 685 The result is a list of references to instances of the CIM_ComputerSystem class.
- 686 • The resulting set of references to instances of the CIM_ComputerSystem class where the
- 687 property Dedicated matches “38 (Ethernet Switch)” represent Ethernet switches that are hosted
- 688 by the host system. From this list the client invokes the intrinsic AssociatorNames() CIM
- 689 operation on each element for an associated CIM_VirtualEthernetSwitchSettingData as follows:
- 690 • The value of the ObjectName parameter is set to refer to the instance of the
- 691 CIM_ComputerSystem class received in the previous operation.
- 692 • The value of the AssocClass parameter is set to "CIM_SettingsDefineState".
- 693 • The value of the ResultClass parameter is set to "CIM_VirtualEthernetSwitchSettingData".
- 694 **Result:** Each ComputerSystem with an associated instance of CIM_VirtualEthernetSwitchSettingData
- 695 where the VirtualSystemType matches “DMTF:VirtualEthernetSwitch” is a host virtual Ethernet switch.

696 **10 CIM elements**

697 Table 2 lists CIM elements that are defined or specialized for this profile. Each CIM element shall be

698 implemented as described in Table 2. The CIM Schema descriptions for any referenced element and its

699 subelements apply.

700 Clauses 7 (“Implementation”) and 8 (“Methods”) may impose additional requirements on these elements.

701 **Table 2 – CIM Elements: Virtual System Profile**

Element	Requirement	Notes
Classes		
CIM_ComputerSystem	Mandatory	See 10.1.
CIM_ConnectivityCollection	Optional	See 10.2.
CIM_ElementSettingData for CIM_VirtualEthernetSwitchSettingData	Mandatory	See 10.3.
CIM_ElementSettingData for CIM_VLANEndpointSettingData	Conditional	See DMTF DSP1050
CIM_ElementSettingData for CIM_VirtualEthernetPortSettingData	Conditional	See DMTF DSP1050
CIM_HostedCollection	Conditional	See 10.4.
CIM_MemberOfCollection	Mandatory	See 10.5
CIM_NetworkVLAN	Optional	See 10.6
CIM_RegisteredProfile	Mandatory	See 10.7
CIM_SettingsDefineState	Mandatory	See 10.8.
CIM_SystemComponent	Conditional	See 10.9.
CIM_VirtualEthernetSwitchSettingData	Mandatory	See 10.10.
CIM_VirtualSystemSettingDataComponent	Conditional	See 10.11.
Indications		
None defined in this profile		

702 **10.1 CIM_ComputerSystem**

703 The use of the CIM_ComputerSystem class is specialized in the [DSP1052](#) and refined in this profile.

704 The requirements in Table 3 are in addition to those mandated by the [DSP1052](#).

705 **Table 3 – Class: CIM_ComputerSystem**

Elements	Requirement	Notes
Dedicated	Mandatory	See 7.1.1.1.

706 **10.2 CIM_ConnectivityCollection (Optional)**

707 An implementation may use an instance of the CIM_ConnectivityCollection class to represent a collection
 708 of associated CIM_LANEndpoint instances that have current or potential connectivity between the
 709 endpoints in this collection.

710 **10.3 CIM_ElementSettingData (CIM_VirtualEthernetSwitchSettingData)**

711 The CIM_ElementSettingData association associates the top-level instance of the
 712 CIM_VirtualEthernetSwitchSettingData class in a “State” virtual Ethernet switch configuration and top-
 713 level instances of the CIM_VirtualEthernetSwitchSettingData class in other virtual Ethernet Switch system
 714 configurations. The use of the CIM_ElementSettingData class is specialized in the [DSP1052](#) and refined
 715 in this profile.

716 Table 4 lists the requirements for this association.

717 **Table 4 – Association: CIM_ElementSettingData**

Element	Requirement	Notes
ManagedElement	Mandatory	Key: Reference to an instance of the CIM_VirtualEthernetSwitchSettingData class that represents the virtual-switch specific properties of the virtual Ethernet Switch Cardinality: 0..1
SettingData	Mandatory	Key: Reference to an instance of the CIM_VirtualEthernetSwitchSettingData class that represents a virtual Ethernet switch configuration Cardinality: *
IsDefault	Mandatory	None
IsCurrent	Unspecified	None
IsNext	Mandatory	None
IsMinimum	Mandatory	Shall be set to 1 (Not Applicable)
IsMaximum	Mandatory	Shall be set to 1 (Not Applicable)

NOTE 1: The cardinality of the ManagedElement role is 0..1 (and not 1) because there are instances of the CIM_VirtualEthernetSwitchSettingData class that do not have an associated instance of the CIM_VirtualEthernetSwitchSettingData class through the CIM_ElementSettingData association.
NOTE 2: The cardinality of the SettingData role is * (and not 1) because there are instances of the CIM_VirtualEthernetSwitchSettingData class that do not have an associated instance of the CIM_VirtualEthernetSwitchSettingData class through the CIM_ElementSettingData association.

718 **10.4 CIM_HostedCollection (conditional)**

719 The CIM_HostedCollection association may associate an instance of the CIM_ComputerSystem class
 720 representing a virtual Ethernet Switch and an instance of CIM_NetworkVLAN or associates an instance of
 721 the CIM_System class representing the host system and an instance of CIM_ConnectivityCollection.

722 Support of the CIM_HostedCollection association is conditional on the support of CIM_NetworkVLAN or
 723 CIM_ConnectivityCollection.

724 Table 5 lists the requirements for this association.

725 **Table 5 – Association: CIM_HostedCollection**

Elements	Requirement	Notes
Antecedent	Mandatory	Key: Reference to an instance of the CIM_ComputerSystem class that represents a virtual Ethernet Switch or the instance of CIM_ComputerSystem class that represent the host. Cardinality: 1
Dependent	Mandatory	Key: Reference to an instance of CIM_NetworkVLAN or an instance of CIM_ConnectivityCollection Cardinality: *

726 **10.5 CIM_MemberOfCollection (optional)**

727 The CIM_MemberOfCollection association associates an aggregation of instances of the
 728 CIM_ProtocolEndpoint class representing either a CIM_VLANEndpoint instances or CIM_LANEndpoint
 729 instances to either an instance of CIM_ConnectivityCollection for LAN endpoints or NetworkVLAN for
 730 VLAN endpoints.

731 Table 6 lists the requirements for this association.

732 **Table 6 – Association: CIM_MemberOfCollection**

Elements	Requirement	Notes
CIM_Collection	Mandatory	Key: Reference to an instance of the CIM_ProtocolEndpoint Cardinality: 1
CIM_ManagedElement	Mandatory	Key: Reference to an instance of CIM_NetworkVLAN or an instance of CIM_ConnectivityCollection Cardinality: *

733 **10.6 CIM_NetworkVLAN (optional)**

734 The CIM_NetworkVLAN class represents a collection of VLANEndpoints that are members of the VLAN.
 735 If modeling switches with VLAN support, there should be an instance of NetworkVLAN for every VLAN
 736 available in a switch.

737 Table 7 contains the requirements for this association specific to this profile.

738 **Table 7 – Class: CIM_NetworkVLAN**

Element	Requirement	Notes
TypeOfMedia	Mandatory	See 7.3

739 **10.7 CIM_RegisteredProfile**

740 The use of the CIM_RegisteredProfile class is specialized by the [DSP1033](#). The requirements denoted in
 741 Table 8 are in addition to those mandated by the [DSP1033](#).

742 **Table 8 – Class: CIM_RegisteredProfile**

Elements	Requirement	Notes
RegisteredOrganization	Mandatory	Shall be set to 2 (DMTF)
RegisteredName	Mandatory	Shall be set to “Virtual Ethernet Switch”
RegisteredVersion	Mandatory	Shall be set to the version of this profile: “1.1.0b”

743 **10.8 CIM_SettingsDefineState**

744 The CIM_SettingsDefineState association associates an instance of the CIM_ComputerSystem class
 745 representing a virtual Ethernet Switch and an instance of the CIM_VirtualEthernetSwitchSettingData class
 746 that represents the virtualization-specific properties of a virtual system and is the top-level instance of the
 747 “State” virtual system configuration.

748 Table 9 contains the requirements for this association.

749 **Table 9 – Association: CIM_SettingsDefineState**

Elements	Requirement	Notes
ManagedElement	Mandatory	Key: Reference to an instance of the CIM_ComputerSystem class that represents a virtual Ethernet switch Cardinality: 0..1
SettingData	Mandatory	Key: Reference to an instance of the CIM_VirtualEthernetSwitchSettingData class that represents the virtualization-specific properties of a virtual system Cardinality: 1
NOTE: The cardinality of the ManagedElement role is 0..1 (and not 1) because there are instances of the CIM_VirtualEthernetSwitchSettingData class that do not have an associated instance of the CIM_ComputerSystem class through the CIM_SettingsDefineState association.		

750 **10.9 CIM_SystemComponent**

751 The CIM_SystemComponent association associates an instance of the CIM_ComputerSystem class
 752 representing a virtual Ethernet Switch and one or more instances of the CIM_ResourcePool class that
 753 represent a pool of available Ethernet switch port connections for allocation to a virtual computer system.

754 Table 10 lists the requirements for this association.

755 **Table 10 – Association: CIM_SystemComponent**

Elements	Requirement	Notes
GroupComponent	Mandatory	Key: Reference to an instance of the CIM_ComputerSystem class that represents a virtual Ethernet Switch Cardinality: 1
PartComponent	Mandatory	Key: Reference to an instance of the CIM_ResourcePool that represents a pool of allowable Ethernet Connection allocations Cardinality: *

756 **10.10 CIM_VirtualEthernetSwitchSettingData**

757 The CIM_VirtualEthernetSwitchSettingData class specializes the CIM_VirtualSystemSettingData class,
758 specified in the [DSP1057](#), by adding switch-specific properties.

759 The requirements in Table 11 are in addition to those mandated by the [DSP1057](#).

760 Table 11 contains the requirements for this class.

761 **Table 11 – Class: CIM_VirtualEthernetSwitchSettingData**

Element	Requirement	Notes
VirtualSystemType	Mandatory	See 7.2.1.
AssociatedResourcePool	Mandatory	See 7.2.2.
EVBmode	Mandatory	See 7.2.3.
VLANConnection	Optional	See 7.2.3.
