Plastics in soils

where our food grows

Plastic particles are polluting our soils, entering the food chain and the environment. One third of the plastic produced globally ends up in our soils.

Policies are needed

to prevent the use of excessive packaging by the industry. But YOU can also take action: carry a reusable bottle and grocery bag, and buy products with reduced or recycled packaging. Contribute to the awareness-raising campaign for reducing the use of plastics! #BeatPlasticPollution.

BE THE SOLUTION TO SOIL POLLUTION
