Agrochemicals

benefits and hazards

While agrochemicals are crucial to meeting the increasing demand for food by a growing world population, they leave a legacy of soil pollution and degraded agroecosystems. 58% of the top agricultural soils in 11 European countries contain residues of multiple persistent pesticides.

Meet the twin challenges

of food security and environmental protection by reducing the excessive use of agrochemicals, promoting the responsible use and management of agrochemicals and sustainable soil management.

BE THE SOLUTION TO SOIL POLLUTION
