

NATIONAL HURRICANE CENTER

OFFICIAL TROPICAL CYCLONE VERIFICATION

1972

D

DESCRIPTION OF VERIFICATION PROCEDURE

The following tables contain the verification scores for the National Hurricane Center tropical cyclone track forecasts (designated 'OFFICIAL' in tables) together with those for all operationally available objective techniques.

The forecast errors, expressed in terms of nautical miles, are computed in the following way. The magnitude of the vector difference (along a great circle) between the forecast displacement for a given time period and the actual displacement taken from the 'best track' is computed for each forecast. All forecasts for which a given system maintains tropical storm or hurricane intensity are verified. These results are then averaged and tabulated.

The errors in the initial positioning of storms are also computed. For a given forecast, this is simply the magnitude of the great circle distance between the operational initial position and the corresponding 'best track' position.

In the tables the number of forecasts included in each sample is given below the mean displacement error for each category.

The first set of tables contains scores for all operationally available forecasts. The second set is a homogeneous sample of OFFICIAL, NHC-72, HURRAN and CLIPER forecasts. Other homogeneous sample groupings are omitted due to limited sample sizes.

1972 TROPICAL CYCLONE FORECAST VERIFICATION

PART I: ALL STORMS, ALL FORECASTS
