

Medroxyprogesterone Acetate IM Injection Package

Procured by UNFPA

The MPA IM injection is available in a combined package of 10 or 20 vials and syringes* (1 mL), including a leaflet. The contraceptive contains progestin, preventing pregnancy by preventing ovulation and thickening the mucus at the cervix.

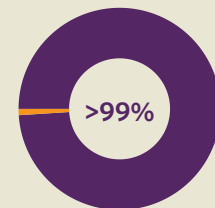

Must be administered by a health care provider

Highly effective.
Effectiveness depends on getting injections regularly

The injection must be taken once every three months

Injectable Contraceptive

Benefits

Includes vials and syringes in one combined package, making it easier to distribute at all levels in the supply chain, including quantification at warehouses

High effectiveness in preventing pregnancy for 3 months

Suitable for all health facilities

**Package of 10 vials is ordered through UNFPA only. Package of 20 vials is available through USAID/UNFPA.*
