COMMENT: Mon Jul 1 20:30:27 GMT 1996

Extended the dome slot.

DPMON COMMENT: Mon Jul 1 20:47:36 GMT 1996

It looks like the reason for the clipped disk images is that the occulting wheel is still turning when the camera is taking the image. I can see this by comparing the MCC status lights with the Camera field in the Status window.

Mon Jul 1 22:05:31 GMT 1996 CHIP End Water

DPMON COMMENT: Mon Jul 1 22:07:51 GMT 1996

After talking with David we have a temporary solution to the clipped disk images, use Kill and Run (after killing all tasks except Xsun and Camera as usual) to restart the observing program. Apparently sometimes an extra WaitOptics command (or something like that) gets issued and the program gets tricked into taking images too early (before the occulting wheel is finished moving). Also, the dust visible on the Display window images is probably on the Camera window images as well but isn't visible there because the limb brightness isn't accentuated. So, when the guys come out to do the lowk work next time we can clean the camera chip since we'll have to move the camera anyway, that way we don't have to worry about refocusing the image like we would if we moved the camera now to remove the dust.

The dust should be removed from the calibrated images anyway.
