LOW-L COMMENT: Sat Sep 13 19:15:05 GMT 1997

While we were rerouting the heat exchanger inlets and hoses Kim noticed that there was no air being pushed by the Smartfan. The display for Fan Voltage showed 99.95 so the fan should have been on all the time. The drive voltage was dropping too low to drive the fan even though the open circuit voltage was about 30.0 volts. So not enough current was getting through. We installed the spare smartfan module to see if that would solve the problem. Now the fan voltage is -80.0 and heading towards 0.0 We'll see if the fan functions eventually, it isn't working yet.

DPMON COMMENT: Sat Sep 13 19:20:42 GMT 1997

The thin loop prominence that was at PA=315-330 has faded away now.

Activity report:

QP: 42; 65-80; 130; 204; 248; 298.

AP: Large but faint loop prominence at PA=315-330, RV=1.25, visible from start of observations until around 1920ut.

No coronal activity.

TAPES:

MKIII: Down for changeover work.

DPMON: P00985

CHIP: C00406

LOWL: L00472 in drive #0

LOW-L COMMENT: Sat Sep 13 23:04:21 GMT 1997

Weather didn't get hot enough to test the spare Smartfan module, it is installed loosely and the Lowl is closed up for now. Problem may also be a bad power supply that the module regulates, but we are trying out the module first.
