\*\*PICS PROBLEM\*\*: Sat Oct 31 20:37:18 GMT 1998

The occulting varies a lot more than it did before the MKIV installation.

Probably due to Spar balance, I'll check balance when I get a chance.

\*\*PSPT PROBLEM\*\*: Sat Oct 31 20:38:37 GMT 1998

I checked the relays in the dome controller box, nothing obviously wrong looking. There are 2 solid state relays (5vdc to 135vac) for computer control and 2 large mechanical relays for dome movement control. The 135 vac is strange and probably related to the 30 vac difference between Neutral and Ground that we have on the new wing due to the new isolation transformer. The mechanical relays sometimes chatter when the

box power switch is left on, this happens even if the computer control cable is disconnected from the solid state relays. Maybe those solid state relays are bad or maybe that elevated Neutral is causing a problem. I'll try to do some DMM measurements when the relays are chattering to see where the voltage change is coming from. Normal inputs are +5vdc for all 4 solid state relay wires and ~135 vac for all 4 mechanical relay wires (to coils) when the dome is at a state of rest and the power switch is on for the box and the PSPT program is running.

MKIV COMMENT: Sat Oct 31 20:57:30 GMT 1998

It looks like there is enough room for todays files, /local/d is only up to 70% full, from about 40% this morning.

\*\*PSPT PROBLEM\*\*: Sat Oct 31 21:58:49 GMT 1998

I checked the voltages at the relays when the directional relay was chattering, the solid state relay was closing the switch on the high voltage output side even though the input wires both stayed at +5 volts. So that solid stae relay needs to be replaced, I can't see any brand but the model number is OAC5-A. Cycling the power to the box resets the bad relay switch back to the open position.
