MKIII PROBLEM: Mon Apr 26 20:33:10 GMT 1999

Gain correct step kept moving inward, but the amplitude of the step became greater in relation to the overall amplitude increasing its contrast in the display image. We decided that the contrast is not as apparent if the step occurs further out in the corona. We decided to take the first correct and copy it into the cortab0.current and call that good.

Scan looks good at high gain throughout the height.

MKIII PROBLEM: Mon Apr 26 21:22:45 GMT 1999

Outer ring of hoisted pixels are still present in all of the post-correct attempt coronal scans. Trying an AN2 swap again and taking coronal data with a different set of MDACs.

Swapped AN4 with spare. (A/D converters). Ring still there.

May be that we have pixels that are finally dying on our last good Reticon array set.

MKIII PROBLEM: Mon Apr 26 22:19:43 GMT 1999

Swapped out all the appropriate hardware and ran numerous corrects and calibrations to try to eliminate the outer ring to no avail. There may be contamination on the detectors but that would involve removal to

inspect and all alignment will be lost in doing so. At this point in the ACOS program, that would not be an option. We decided to live with the ring as it occurs in a region that is well covered by the MKIV.
