MLSO PROBLEM : Sun Jun 11 19:31:31 GMT 2006

No dial tones on either telephone line. I used our cellphone and called 1-877-482-3900 just now and spoke to Kawai, she is currently testing our lines. I gave her our cellphone number 987-1697 to call me back after the testing. They may need to send someone out here on Wednesday to fix things, that person will call our cellphone number if necessary, so we need to keep the cellphone handy up here until things are fixed. The cellphone won't sit as designed in the charging cradle due to the stick-on clip, but that's OK, with a little patience you can get it to sit well enough in the cradle that the charging light will come on and indicate that it is charging.

****PICS PROBLEM****: Sun Jun 11 23:30:04 GMT 2006

I've been bouncing the spar around working on the occulting wheel problem. Watching the GUI I can see the stations cycle through Clear, PICS, Wedge, Wedge, Wedge, Dark. The correct sequence should be Clear, PICS, Occult, Reticule, Wedge, Dark. The LED for Bit #2 on the PICS Occulting Wheel Status board never lights, so Occult and Reticule stations are never read now. I tried changing the board with a spare, restarting MCC, restarting Patrol, and I even went through the laborious task of changing the HEI optical switch for the Bit #2 reading, the one on the disk that is farthest from the Occulting Wheel. Before I changed the switch I noticed that the Bit #2 LED didn't light though the old switch was still connected and nothing was blocking the sensors - it was hanging free from the actuating disk. When So I connected the new switch and got the same result - no LED lit for Bit #2. I installed the new switch anyway and it didn't help, right now it is hanging free and I'm taking a break from this problem.

****PICS PROBLEM****: Mon Jun 12 01:07:44 GMT 2006

I re-installed the new HEI switch for Bit #2. I checked voltages there and at the other HEI for Bits #0 and #1, I see a voltage of about 0.6 for the Bit #2 switch and about 1.3 vdc for the other switch, I expected to see something low for the Bit #2 switch but I don't understand the low voltage on the other switch - I expected to see about 5 vdc according to the drawings I found. Anyway I suspect a bad power supply in the "Y-box" as labeled in the drawings. I'm kind of worn out for today so I'll leave that voltage check for the guys tomorrow.
