COMP COMMENT BY berkey: Thu Jun 30 03:46:20 GMT 2016

Spend a bit more time with the forked CoMP code looking at how to move data around for UCoMP. And also just trying to understand everything that CoMP does under the hood.

By moving the disk access out of Run Recipe and some other tweaks I have been able to shave 2 seconds off the waves recipe (1074_QU_3_250ms_2beam.rcp). And it looks like the timing between the successive data files is more predictable than the deployed comp code timing.

The bad news is I think I am doing something wrong; the fastest I should be able to chew though a waves recipe is 24.50 seconds accounting for camera read time and lcvr relaxation time. However at last check I am able to run a waves recipe in 23.8+.05 seconds. Right now I cannot account for the .7seconds+over head of running the code. I think there may be some small error the way we calculate the LCNT value in labview. The manual claims we should use 4.1666 as a magic number but the code uses 4.166. I haven't yet gone back to see if this is enough to clear up the problem, but it seems like the magnitude of the error is too small to explain it.

We are now running the unedited code.
