Year: 16 Doy: 261

Observer: waters

WEATHER COMMENT: waters: Sat Sep 17 16:38:22 GMT 2016

Temp 44F with windspeed at about 6mph. Thin cirrus covering most of the sky at present, with a cumulus formation to the East and at about 10,000ft, possibly climbing. Will wait to open the dome till the sky clears a bit.

GONG COMMENT BY waters: Sat Sep 17 22:04:09 GMT 2016

Went down to the GONG shelter to cycle the instrument control computer a couple times; it seemed to be getting hung up. The second recycled seems to have worked.

GENERAL OBSERVATORY COMMENT BY waters: Sat Sep 17 22:47:17 GMT 2016

Fog currently around the observatory. Clouds have also taken over but from the small holes I see now and then, there is thick cirrus high above. Heading down early and hoping tomorrow is a better day for us.
