KCOR COMMENT BY berkey: Sat Apr 28 01:42:50 GMT 2018

Holding off doing a Occulter change until we figure out the source of the bright spikes that appear to come out of the "E" in the ngrf images.

There is some expectation that the source is some sort of misalignment or glint coming off the current occulter.

Per the forecast it may take a few days before we are able to go back on sky and do a visual inspection around the occulter.
