

In *Principles of Dynamics*, the subject of "The  
Principle of Conservation of Energy" was an interesting, in  
fact, a brilliant, one. In the last century, as the science  
was in the process of growth, and the laws were  
being discovered, it was not possible to give a  
clear and definite statement of the principle, and  
it was not until the middle of the nineteenth century  
that the principle was fully established. The  
principle is not a simple one, and it is not  
immediately obvious, but it is one of the most  
important principles in natural science, and  
it is one of the most beautiful and most  
profitable ones. The book in which the principle is  
first stated is that of Laplace, and it is one of  
the most beautiful and most profitable ones.

And he showed equal proficiency with reference to  
some other matters that came within the scope  
of his researches and operations. His studies  
of the principles of dynamics and of the  
principles of mechanics and of the

occupies the remainder of the volume, is a  
study of the principles of dynamics and  
of the principles of mechanics, with a view of  
establishing the accuracy of the  
principles of dynamics and of the  
principles of mechanics.
