

# Package ‘PICB’

February 19, 2025

**Title** piRNA Cluster Builder

**Version** 0.99.15

**Description** piRNAs (short for PIWI-interacting RNAs) and their PIWI protein partners play a key role in fertility and maintaining genome integrity by restricting mobile genetic elements (transposons) in germ cells. piRNAs originate from genomic regions known as piRNA clusters. The piRNA Cluster Builder (PICB) is a versatile toolkit designed to identify genomic regions with a high density of piRNAs. It constructs piRNA clusters through a stepwise integration of unique and multimapping piRNAs and offers wide-ranging parameter settings, supported by an optimization function that allows users to test different parameter combinations to tailor the analysis to their specific piRNA system. The output includes extensive metadata columns, enabling researchers to rank clusters and extract cluster characteristics.

**License** CC0

**Encoding** UTF-8

**Imports** utils, GenomicRanges, GenomicAlignments, GenomeInfoDb, Biostrings, Rsamtools, data.table, IRanges, seqinr, stats, openxlsx, dplyr, S4Vectors, methods

**Suggests** knitr, rtracklayer, testthat, BiocStyle, prettydoc, BSgenome, BSgenome.Dmelanogaster.UCSC.dm6, BiocManager, rmarkdown, ggplot2

**VignetteBuilder** knitr

**BugReports** <https://github.com/HaaseLab/PICB/issues>

**URL** <https://github.com/HaaseLab/PICB>

**biocViews** Genetics, GenomeAnnotation, Sequencing, FunctionalPrediction, Coverage, Transcriptomics

**RoxygenNote** 7.3.2

**git\_url** <https://git.bioconductor.org/packages/PICB>

**git\_branch** devel  
**git\_last\_commit** 7163d82  
**git\_last\_commit\_date** 2025-02-06  
**Repository** Bioconductor 3.21

PICB-package

*PICB: piRNA Cluster Builder*

---

## Description

piRNAs (short for PIWI-interacting RNAs) and their PIWI protein partners play a key role in fertility and maintaining genome integrity by restricting mobile genetic elements (transposons) in germ cells. piRNAs originate from genomic regions known as piRNA clusters. The piRNA Cluster Builder (PICB) is a versatile toolkit designed to identify genomic regions with a high density of piRNAs. It constructs piRNA clusters through a stepwise integration of unique and multimapping piRNAs and offers wide-ranging parameter settings, supported by an optimization function that allows users to test different parameter combinations to tailor the analysis to their specific piRNA system. The output includes extensive metadata columns, enabling researchers to rank clusters and extract cluster characteristics.

## Main Functions

The package provides several core functions:

- PICBload: Load and preprocess BAM files containing piRNA alignments
- PICBbuild: Build piRNA seeds/cores/clusters from alignments
- PICBoptimize: Optimize parameters for cluster building
- PICBstrandanalysis: Add sense/antisense ratio of unique piRNAs per piRNAcluster
- PICBannotate: Annotate GRanges according to a piRNA library
- PICBloadfasta: Get SeqInfo object from a fasta file
- PICBexporttoexcel: Export cluster object into an Excel file
- PICBimporttoexcel: Import cluster object from an Excel file

## Workflow

A typical PICB workflow consists of:

1. Loading alignments with PICBload
2. Building clusters with PICBbuild
3. Optional parameter optimization with PICBoptimize
4. Optional strand analysis with PICBstrandanalysis
5. Exporting results with PICBexporttoexcel

## Author(s)

**Examples**

```
# 0. Load PICB
library(PICB)

# 1. Load Required Genome from e.g. Seqinfo (check all options in Vignette or ReadMe)
myGenome <- GenomeInfoDb::Seqinfo(
  seqnames = c("chr2L", "chr2R", "chr3L", "chr3R", "chr4", "chrX", "chrY"),
  seqlengths = c(23513712, 25286936, 28110227, 32079331, 1348131, 23542271, 3667352)
)

# 2. Load Example Data and Process Alignments
bam_file <- system.file("extdata", "Fly_Ov1_chr2L_20To21mb_filtered.bam",
  package = "PICB")

myAlignments <- PICBload(
  BAMFILE = bam_file,
  REFERENCE.GENOME = myGenome,
  VERBOSE = FALSE
)

# 3. Build piRNA Clusters
myClusters <- PICBbuild(
  IN.ALIGNMENTS = myAlignments,
  REFERENCE.GENOME = myGenome,
  LIBRARY.SIZE = 12799826, # Usually calculated automatically
  VERBOSITY = 0
)$clusters

# 4. Optimize Parameters (Optional)
parameterExploration <- PICBoptimize(
  IN.ALIGNMENTS = myAlignments,
  REFERENCE.GENOME = myGenome,
  MIN.UNIQUE.ALIGNMENTS.PER.WINDOW = c(1, 2, 3, 4, 5),
  LIBRARY.SIZE = 12799826, # Usually calculated automatically
  VERBOSITY = 1
)

# 5. Perform Strand Analysis
myClustersWithStrand <- PICBstrandanalysis(
  IN.ALIGNMENTS = myAlignments,
  IN.RANGES = myClusters
)

# 6. Export Clusters
PICBexporttoexcel(
  IN.RANGES = myClustersWithStrand,
  EXCEL.FILE.NAME = "myClusters_demonstration.xlsx"
)

# 7. Import Ranges
importedClusters <- PICBimportfromexcel(
  EXCEL.FILE.NAME = system.file("extdata", "myClusters_demonstration.xlsx", package = "PICB")
)
```

---

PICBannotate	<i>Annotate GRanges according to a piRNA library</i>
--------------	--

---

## Description

Annotate GRanges according to a piRNA library

## Usage

```
PICBannotate(
  INPUT.GRANGES,
  ALIGNMENTS,
  REFERENCE.GENOME = NULL,
  REPLICATE.NAME = NULL,
  LIBRARY.SIZE = length(ALIGNMENTS$unique) + length(ALIGNMENTS$multi.primary),
  PROVIDE.NON.NORMALIZED = FALSE,
  SEQ.LEVELS.STYLE = "UCSC",
  COMPUTE.1U.10A.FRACTIONS = FALSE
)
```

## Arguments

**INPUT.GRANGES** GRanges (seeds/cores/clusters) to annotate

**ALIGNMENTS** list of alignments from PICBload

**REFERENCE.GENOME** name of genome. For example "BSgenome.Dmelanogaster.UCSC.dm6"

**REPLICATE.NAME** name of the replicate. NULL by default.

**LIBRARY.SIZE** number of reads in the library. By default computed as number of unique mapping alignments + number of primary multimapping alignments.

**PROVIDE.NON.NORMALIZED** provide annotations in non-normalized format. False by default.

**SEQ.LEVELS.STYLE** naming of chromosomes style. "UCSC" by default.

**COMPUTE.1U.10A.FRACTIONS** for each locus and each alignments type (unique mapping, primary multimapping, secondary multimapping) compute fraction 1U and 10A containing reads overlapping the locus. Default FALSE.

## Value

GRanges object with extra annotation columns

## Author(s)

Aleksandr Friman

**Examples**

```

library(BSgenome.Dmelanogaster.UCSC.dm6)
myGenome <- "BSgenome.Dmelanogaster.UCSC.dm6"
myAlignmentsFromPICBload <- PICBload(
  BAMFILE = system.file("extdata", "Fly_Ov1_chr2L_20To21mb_filtered.bam", package = "PICB"),
  REFERENCE.GENOME = myGenome,
  VERBOSE = FALSE
)
myRangesFromPICBbuild <- PICBbuild(
  IN.ALIGNMENTS = myAlignmentsFromPICBload,
  REFERENCE.GENOME = myGenome,
  VERBOSITY = 0
)

myClustersFromPICBbuildAnnotationsRemoved <- GenomicRanges::granges(myRangesFromPICBbuild$clusters)

PICBannotate(
  INPUT.GRANGES = myClustersFromPICBbuildAnnotationsRemoved,
  ALIGNMENTS = myAlignmentsFromPICBload,
  REFERENCE.GENOME = myGenome,
  PROVIDE.NON.NORMALIZED = TRUE
)

```

---

PICBbuild

*Build piRNA seeds/cores/clusters from alignments*

---

**Description**

Build piRNA seeds/cores/clusters from alignments

**Usage**

```

PICBbuild(
  IN.ALIGNMENTS,
  REFERENCE.GENOME,
  UNIQUEMAPPERS.SLIDING.WINDOW.WIDTH = 350,
  UNIQUEMAPPERS.SLIDING.WINDOW.STEP = round(UNIQUEMAPPERS.SLIDING.WINDOW.WIDTH/10, 0),
  PRIMARY.MULTIMAPPERS.SLIDING.WINDOW.WIDTH = 350,
  PRIMARY.MULTIMAPPERS.SLIDING.WINDOW.STEP =
    round(PRIMARY.MULTIMAPPERS.SLIDING.WINDOW.WIDTH/10, 0),
  SECONDARY.MULTIMAPPERS.SLIDING.WINDOW.WIDTH = 1000,
  SECONDARY.MULTIMAPPERS.SLIDING.WINDOW.STEP =
    round(SECONDARY.MULTIMAPPERS.SLIDING.WINDOW.WIDTH/10, 0),
  LIBRARY.SIZE = length(IN.ALIGNMENTS$unique) + length(IN.ALIGNMENTS$multi.primary),
  MIN.UNIQUE.ALIGNMENTS.PER.WINDOW = 2 * (UNIQUEMAPPERS.SLIDING.WINDOW.WIDTH/1000) *
    (LIBRARY.SIZE/1e+06),
  MIN.UNIQUE.SEQUENCES.PER.WINDOW = min(MIN.UNIQUE.ALIGNMENTS.PER.WINDOW,
    round(UNIQUEMAPPERS.SLIDING.WINDOW.WIDTH/50, 0)),

```

```

MIN.PRIMARY.MULTIMAPPING.ALIGNMENTS.PER.WINDOW = 4 *
    (PRIMARY.MULTIMAPPERS.SLIDING.WINDOW.WIDTH/1000) * (LIBRARY.SIZE/1e+06),
MIN.SECONDARY.MULTIMAPPING.ALIGNMENTS.PER.WINDOW = 0.2 *
    (SECONDARY.MULTIMAPPERS.SLIDING.WINDOW.WIDTH/1000) * (LIBRARY.SIZE/1e+06),
MIN.SEED.LENGTH = 2 * UNIQUEMAPPERS.SLIDING.WINDOW.WIDTH + 100,
MIN.COVERED.SEED.LENGTH = 0,
THRESHOLD.SEEDS.GAP = 0,
THRESHOLD.CORES.GAP = 0,
THRESHOLD.CLUSTERS.GAP = 0,
SEQ.LEVELS.STYLE = "UCSC",
MIN.OVERLAP = 5,
PROVIDE.NON.NORMALIZED = FALSE,
COMPUTE.1U.10A.FRACCTIONS = FALSE,
VERBOSITY = 2
)

```

### Arguments

IN.ALIGNMENTS list of alignments from PICBload

REFERENCE.GENOME  
name of genome. For example "BSgenome.Dmelanogaster.UCSC.dm6"

UNIQUEMAPPERS.SLIDING.WINDOW.WIDTH  
width of sliding window for unique mappers. 350 nt by default

UNIQUEMAPPERS.SLIDING.WINDOW.STEP  
step of sliding windows for unique mappers. width/10 by default

PRIMARY.MULTIMAPPERS.SLIDING.WINDOW.WIDTH  
width of sliding window for primary multimapping alignments. 350 nt by default

PRIMARY.MULTIMAPPERS.SLIDING.WINDOW.STEP  
step of sliding windows for primary multimapping alignments. width/10 by default

SECONDARY.MULTIMAPPERS.SLIDING.WINDOW.WIDTH  
width of sliding window for secondary multimapping alignments. 1000 nt by default

SECONDARY.MULTIMAPPERS.SLIDING.WINDOW.STEP  
step of sliding windows for secondary multimapping alignments. width/10 by default

LIBRARY.SIZE  
number of reads in the library. By default computed as number of unique mapping alignments + number of primary multimapping alignments.

MIN.UNIQUE.ALIGNMENTS.PER.WINDOW  
absolute number of unique mapping alignments per window to call it. By default computed as 2 FPKM.

MIN.UNIQUE.SEQUENCES.PER.WINDOW  
absolute number of unique mapping sequences per window to call it. By default computed as width/50.

MIN.PRIMARY.MULTIMAPPING.ALIGNMENTS.PER.WINDOW  
absolute number of primary multimapping alignments per window to call it. By default computed as 4 FPKM.

MIN.SECONDARY.MULTIMAPPING.ALIGNMENTS.PER.WINDOW	absolute number of secondary multimapping alignments per window to call it. By default computed as 0.2 FPKM.
MIN.SEED.LENGTH	minimum length of a seed. By default computed as 2x unique mapper window size + 100.
MIN.COVERED.SEED.LENGTH	minimum number of seed nucleotides covered by unique mappers. 0 by default.
THRESHOLD.SEEDS.GAP	minimum gap between seeds to not merge them. 0 by default.
THRESHOLD.CORES.GAP	minimum gap between cores to not merge them. 0 by default.
THRESHOLD.CLUSTERS.GAP	minimum gap between clusters to not merge them. 0 by default.
SEQ.LEVELS.STYLE	naming of chromosomes style. "UCSC" by default.
MIN.OVERLAP	minimum overlap between seeds and cores, as well as between cores and clusters 5 nt by default.
PROVIDE.NON.NORMALIZED	include non-normalized to the library size statistics in the output annotations
COMPUTE.1U.10A.FRACTIONS	for each locus and each alignments type (unique mapping, primary multimapping, secondary multimapping) compute fraction 1U and 10A containing reads overlapping the locus. Default FALSE.
VERBOSITY	verbosity level 0/1/2/3. 2 by default.

**Value**

list of annotated GRanges objects named "seeds" for seeds, "cores" for cores, "clusters" for clusters

**Author(s)**

Pavol Genzor  
 Daniel Stoyko  
 Aleksandr Friman  
 Franziska Ahrend

**Examples**

```
library(BSgenome.Dmelanogaster.UCSC.dm6)
myAlignmentsFromPICBload <- PICBload(
  BAMFILE = system.file("extdata", "Fly_Ov1_chr2L_20To21mb_filtered.bam", package = "PICB"),
  REFERENCE.GENOME = "BSgenome.Dmelanogaster.UCSC.dm6",
  VERBOSE = FALSE
)

outputOfPICBbuild <- PICBbuild(
```

```
    IN.ALIGNMENTS = myAlignmentsFromPICBload,  
    REFERENCE.GENOME = "BSgenome.Dmelanogaster.UCSC.dm6",  
    VERBOSITY = 0  
  )
```

---

PICBexporttoexcel      *Export cluster object into an Excel file*

---

### Description

Export cluster object into an Excel file

### Usage

```
PICBexporttoexcel(IN.RANGES = NULL, EXCEL.FILE.NAME = NULL)
```

### Arguments

```
IN.RANGES            clustering object to export  
EXCEL.FILE.NAME      file name to save
```

### Value

no values returned

### Author(s)

Aleksandr Friman  
Franziska Ahrend

### Examples

```
library(BSgenome.Dmelanogaster.UCSC.dm6)  
myAlignmentsFromPICBload <- PICBload(  
  BAMFILE = system.file("extdata", "Fly_Ov1_chr2L_20To21mb_filtered.bam", package = "PICB"),  
  REFERENCE.GENOME = "BSgenome.Dmelanogaster.UCSC.dm6",  
  VERBOSE = FALSE  
)  
  
outputOfPICBbuild <- PICBbuild(  
  IN.ALIGNMENTS = myAlignmentsFromPICBload,  
  REFERENCE.GENOME = "BSgenome.Dmelanogaster.UCSC.dm6",  
  LIBRARY.SIZE = 12799826, #usually not necessary  
  VERBOSITY = 0  
)  
PICBexporttoexcel(  
  IN.RANGES = outputOfPICBbuild,  
  EXCEL.FILE.NAME = "inst/extdata/myClusters_demonstration.xlsx"  
)
```

PICBgetchromosomes     *Get SeqInfo object from standard non-circular chromosome names from your genome*

---

**Description**

Get SeqInfo object from standard non-circular chromosome names from your genome

**Usage**

```
PICBgetchromosomes(REFERENCE.GENOME, SEQ.LEVELS.STYLE = "UCSC")
```

**Arguments**

REFERENCE.GENOME  
name of genome. For example "BSgenome.Dmelanogaster.UCSC.dm6", or directly a SeqInfo object.

SEQ.LEVELS.STYLE  
naming of chromosomes style. "UCSC" by default.

**Value**

SeqInfo object with standard non-circular chromosome names

**Author(s)**

Aleksandr Friman  
Franziska Ahrend

**Examples**

```
library(BSgenome.Dmelanogaster.UCSC.dm6)  
mySI <- PICBgetchromosomes("BSgenome.Dmelanogaster.UCSC.dm6", "UCSC")
```

---

PICBimportfromexcel     *Import cluster object from an Excel file*

---

**Description**

Import cluster object from an Excel file

**Usage**

```
PICBimportfromexcel(EXCEL.FILE.NAME = NULL)
```

**Arguments**

EXCEL.FILE.NAME  
file name to import from

**Value**

list of annotated GRanges objects named "seeds" for seeds, "cores" for cores, "clusters" for clusters

**Author(s)**

Aleksandr Friman

**Examples**

```
importedClusters <- PICBimportfromexcel(  
  EXCEL.FILE.NAME = system.file("extdata", "myClusters_demonstration.xlsx", package = "PICB")  
)
```

---

PICBload

*Load and preprocess BAM files containing piRNA alignments*

---

**Description**

Load and preprocess BAM files containing piRNA alignments

**Usage**

```
PICBload(  
  BAMFILE = NULL,  
  REFERENCE.GENOME = NULL,  
  SIMPLE.CIGAR = TRUE,  
  IS.SECONDARY.ALIGNMENT = NA,  
  STANDARD.CONTIGS.ONLY = TRUE,  
  PERFECT.MATCH.ONLY = FALSE,  
  FILTER.BY.FLAG = TRUE,  
  SELECT.FLAG = c(0, 16, 272, 256),  
  USE.SIZE.FILTER = TRUE,  
  READ.SIZE.RANGE = c(18, 50),  
  TAGS = c("NH", "NM"),  
  WHAT = c("flag"),  
  SEQ.LEVELS.STYLE = "UCSC",  
  GET.ORIGINAL.SEQUENCE = FALSE,  
  VERBOSE = TRUE  
)
```

**Arguments**

BAMFILE	name of the bam file to load. Should be sorted and indexed.
REFERENCE.GENOME	name of genome. For example "BSgenome.Dmelanogaster.UCSC.dm6"
SIMPLE.CIGAR	simpleCigar parameter of Rsamtools::ScanBamParam
IS.SECONDARY.ALIGNMENT	defines loading of primary/secondary alignments. Default value NA loads both primary and secondary.
STANDARD.CONTIGS.ONLY	use only standard chromosomes
PERFECT.MATCH.ONLY	load only alignments without mismatches
FILTER.BY.FLAG	enables filtering by flag. TRUE by default.
SELECT.FLAG	vector of flags to use. Default value c(0,16, 272, 256).
USE.SIZE.FILTER	enables filter by alignment size. True by default.
READ.SIZE.RANGE	allowed alignment sizes. c(18,50) by default.
TAGS	tags to import from bam file. c("NH","NM") by default.
WHAT	"what" parameter of Rsamtools::ScanBamParam. c("flag") by default.
SEQ.LEVELS.STYLE	naming of chromosomes style. "UCSC" by default.
GET.ORIGINAL.SEQUENCE	adds "seq" to WHAT. False by default.
VERBOSE	enables progress output. True by default.

**Value**

list of GRanges objects named "unique" for unique mapping alignments, "multi.primary" for primary multimapping alignments, "multi.secondary" for secondary multimapping alignments

**Author(s)**

Pavol Genzor  
 Daniel Stoyko  
 Aleksandr Friman  
 Franziska Ahrend

**Examples**

```
library(BSgenome.Dmelanogaster.UCSC.dm6)
PICBload(
  BAMFILE = system.file("extdata", "Fly_Ov1_chr2L_20To21mb_filtered.bam", package = "PICB"),
  REFERENCE.GENOME = "BSgenome.Dmelanogaster.UCSC.dm6",
  VERBOSE = FALSE
)
```

---

PICBloadfasta	<i>Get SeqInfo object from a fasta file</i>
---------------	---

---

**Description**

Get SeqInfo object from a fasta file

**Usage**

```
PICBloadfasta(FASTA.NAME = NULL)
```

**Arguments**

FASTA.NAME      path to the fasta file

**Value**

SeqInfo object with all chromosome names and lengths from the fasta file

**Author(s)**

Aleksandr Friman

**Examples**

```
library(BSgenome.Dmelanogaster.UCSC.dm6)

# create temporary fasta file
chr2L_seq <- BSgenome.Dmelanogaster.UCSC.dm6[["chr2L"]]
chr2L_seq_set <- DNASTringSet(chr2L_seq)
names(chr2L_seq_set) <- "chr2L"
temp_fasta <- tempfile(fileext = ".fasta")
writeXStringSet(chr2L_seq_set, temp_fasta)

myGenome <- PICBloadfasta(FASTA.NAME = temp_fasta)
unlink(temp_fasta)
```

---

PICBoptimize	<i>Runs PICBbuild multiple times with provided parameters and returns optimization data frame.</i>
--------------	--

---

**Description**

Runs PICBbuild multiple times with provided parameters and returns optimization data frame.

**Usage**

```
PICBoptimize(
  IN.ALIGNMENTS,
  REFERENCE.GENOME,
  LIBRARY.SIZE = length(IN.ALIGNMENTS$unique) + length(IN.ALIGNMENTS$multi.primary),
  VERBOSITY = 2,
  PROVIDE.INFO.SEEDS.AND.CORES = FALSE,
  SEQ.LEVELS.STYLE = "UCSC",
  ...
)
```

**Arguments**

IN.ALIGNMENTS list of alignments from PICBload

REFERENCE.GENOME name of genome. For example "BSgenome.Dmelanogaster.UCSC.dm6"

LIBRARY.SIZE number of reads in the library. By default computed as number of unique mapping alignments + number of primary multimapping alignments.

VERBOSITY verbosity level 0/1/2/3. 2 by default.

PROVIDE.INFO.SEEDS.AND.CORES FALSE by default.

SEQ.LEVELS.STYLE naming of chromosomes style. "UCSC" by default.

... rest of the parameters used by PICBbuild and provided as iterable vectors

**Value**

Optimization values dataframe

**Author(s)**

Aleksandr Friman

**Examples**

```
library(BSgenome.Dmelanogaster.UCSC.dm6)
myAlignmentsFromPICBload <- PICBload(
  BAMFILE = system.file("extdata", "Fly_Ov1_chr2L_20To21mb_filtered.bam", package = "PICB"),
  REFERENCE.GENOME = "BSgenome.Dmelanogaster.UCSC.dm6",
  VERBOSE = FALSE
)

PICBoptimize(
  IN.ALIGNMENTS = myAlignmentsFromPICBload,
  REFERENCE.GENOME = "BSgenome.Dmelanogaster.UCSC.dm6",
  MIN.UNIQUE.ALIGNMENTS.PER.WINDOW = c(1, 2, 3, 4, 5)
)
```

---

PICBstrandanalysis     *Add sense/antisense ratio of unique piRNAs per piRNA cluster*

---

**Description**

Add sense/antisense ratio of unique piRNAs per piRNA cluster

**Usage**

```
PICBstrandanalysis(IN.ALIGNMENTS, IN.RANGES, VERBOSE = TRUE)
```

**Arguments**

IN.ALIGNMENTS     list of alignments from PICBload  
IN.RANGES             single GRanges object (seeds, cores or clusters from PICBbuild)  
VERBOSE             enables progress output. True by default.

**Value**

GRanges object with an additional annotation column

**Author(s)**

Parthena Konstantinidou  
Zuzana Loubalova  
Franziska Ahrend

**Examples**

```
library(BSgenome.Dmelanogaster.UCSC.dm6)
myAlignmentsFromPICBload <- PICBload(
  BAMFILE = system.file("extdata", "Fly_Ov1_chr2L_20To21mb_filtered.bam", package = "PICB"),
  REFERENCE.GENOME = "BSgenome.Dmelanogaster.UCSC.dm6",
  VERBOSE = FALSE
)

outputOfPICBbuild <- PICBbuild(
  IN.ALIGNMENTS = myAlignmentsFromPICBload,
  REFERENCE.GENOME = "BSgenome.Dmelanogaster.UCSC.dm6",
  VERBOSITY = 0
)

outputOfPICBbuild$clusters <- PICBstrandanalysis(
  IN.ALIGNMENTS = myAlignmentsFromPICBload,
  IN.RANGES = outputOfPICBbuild$clusters
)
```
