Using CPX3 to extract data

(1) Start up cpx3
(2) Switch to the desired data mode (raw, edited, clean, average) using the 'display' pull down menu.
(3) Use the 'File' pulldown menu to chose 'export data'
(4) Set the time range and select variables from the list
(5) Click on 'output'
(6) Change to the convert/process data tab. Eventually will get a screen about exporting.
(7) Check the box the 'file' box.
(8) Click on disk icon to set file name and directory. Click save. This will put file name and path in text window
(9) Choose file option settings (they are set to common defaults so you may not need to)
      a. Each option choice opens a pulldown window or checkbox for that choice
      b. Make all file option choices
(10)   Once all file option choices have been made click 'OK' and the file will be generated.

TIP1: You can see what the file will look like if you skip steps 7&8. In this case, once you click 'OK' in step 10, a window will pop up with the data. We recommend using file viewing option only for shorter time series (e.g., 1 week).

TIP2: Once you are happy with how the file looks in the viewing window then extend the time range (step 4) and do steps 7&8 to generate the final file.
