

### **Supplemental Figure legends**

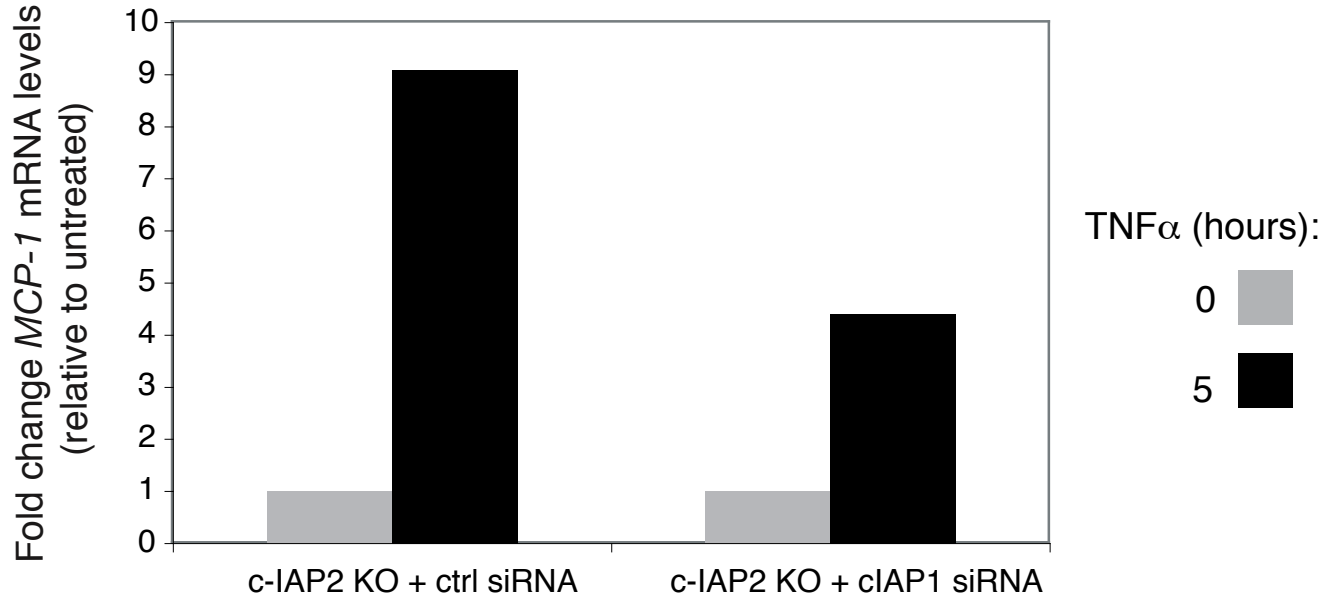

Supplemental Figure 1. c-IAP2-deficient MEFs were transfected with the indicated siRNA oligos and NF- $\kappa$ B reporter plasmid. Fold change in NF- $\kappa$ B activation was determined by the NF- $\kappa$ B activation assay relative to the vector control.

Supplemental Figure 2. Quantitative real-time PCR analysis of *MCP-1* mRNA expression was done on RNA samples derived from c-IAP2-deficient MEFs transfected with the indicated siRNA oligos and treated with TNF $\alpha$  for 5 hours. All values were normalized to a *GAPDH* RNA internal control.

Supplemental Figure 3. Coomassie blue stained gels with recombinant purified wild-type and RING-mutant (RG; H588A) c-IAP1 proteins.
