Permafrost_cci data in AWI WebGIS (public)

- Ground temperature (2m depth) change 1997-2018

Fokus on:

- Land area within 100 km buffer from coast
- Permafrost area only

□ Analysis extent - coastal zone

Permafrost extent (average 2007-2016)

0-10%

10-50%

50-90%

90-100%

Settlement datasets

○ additional settlements within buffer

Wang et al. (2021)

• non-coastal

○ coastal

0 1 000 2 000 km

Bartsch, Pointner, Nitze, Efimova, Jakober, Ley, Högström, Grosse, Schweitzer (2021), ERL

Objectives

- 1) Identify infrastructure potentially impacted by recent climate change
- 2) to document the added value of satellite-derived infrastructure maps along the Arctic coasts compared to existing sources
- 3) to identify and quantify change of recent human impact across the Arctic

<https://permafrostcoasts.org/digital-media/> L. Farquharson, UAF

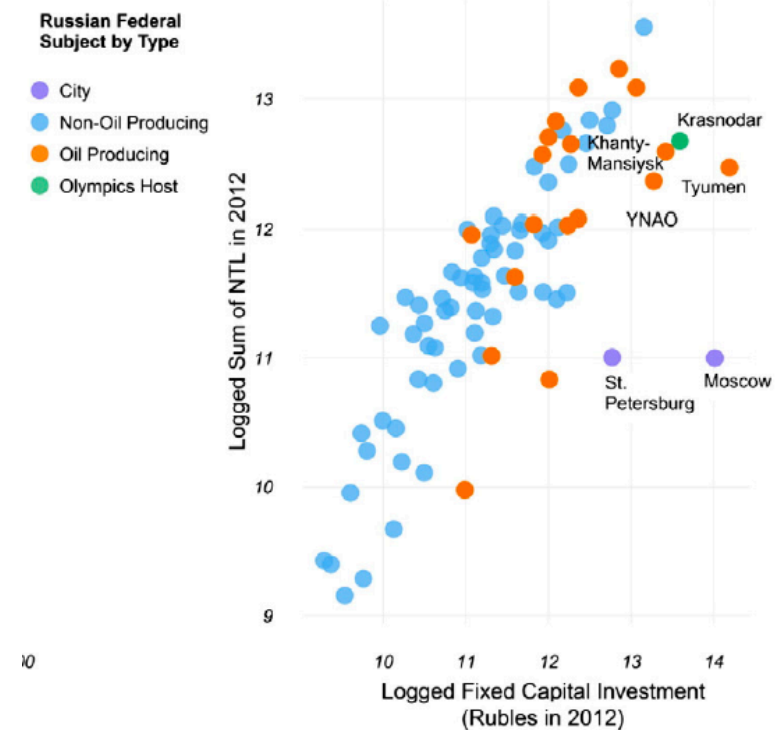

Infrastructure - Currently available records

- Remote sensing
 - Global datasets of **build-up** areas
 - Not all Arctic settlements included, limitation to buildings
 - Global datasets of **nighttime light** information
 - Precise local accounts for some sites
 - Derived manually using aerial photographs and/or very high resolution satellite data

Infrastructure - Currently available records

- Remote sensing
 - Global datasets of **build-up** areas
 - Not all Arctic settlements included, limitation to buildings
 - Global datasets of **nighttime light** information
 - Precise local accounts for some sites
 - Derived manually using aerial photographs and/or very high resolution satellite data

Bennet & Smith 2017

Infrastructure - Currently available records

- Remote sensing
 - Global datasets of **build-up** areas
 - Not all Arctic settlements included, limitation to buildings
 - Global datasets of **nighttime light** information
 - Precise local accounts for some sites
 - Derived manually using aerial photographs and/or very high resolution satellite data
- Open Streep Map
 - Inconsistent information on settlements and infrastructure, many gaps across the Arctic, partially limited geometric accuracy, unknown timestamp
 - But currently most complete account, used in several studies

What else can be provided with satellite data considering new missions?

What data sources could be used?

- Landsat (30m) popular for Arctic landcover mapping but settlements and infrastructure rarely mapped
 - Spatial resolution largely insufficient (e.g. Kumpula et al. 2012)
- Sentinel-1 and Sentinel-2 provide now data at 10 m resolution

- Example Longyearbyen

 - 1 – UNIS building
 - 21 - footpath

- Target classes

 - Buildings
 - Roads
 - Other human impacted area

- GBM also includes

 - Vegetated areas
 - water

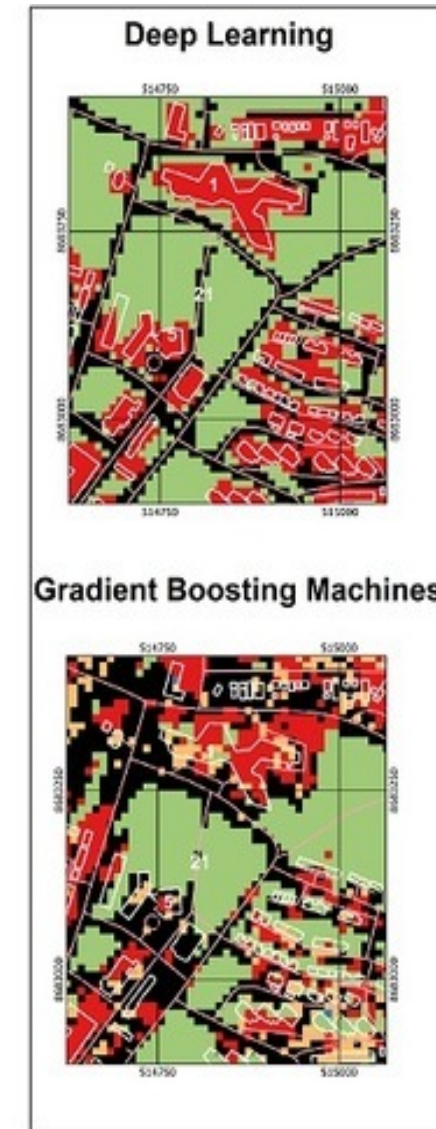

(2016-2018)

Machine Learning
for infrastructure
detection
in the Arctic

based on
Sentinel-1
&
Sentinel-2

Bartsch, Pointer, Ingeman-Nielsen & Lu (2020), RS

Requires vegetation for areas without human impact

Classification errors in high Arctic locations

Southampton Island, Canada – new road to Boas River oil shale site

Example Prudhoe Bay, Alaska

Bartsch, Pointer, Ingeman-Nielsen & Lu (2020), RS

- More than 2400 Sentinel-2 acquisitions at granule extent (2016-2020) processed
- At least one Sentinel-1 acquisition per granule
- 366 Granules with infrastructure and permafrost

Sentinel-1/2 derived Arctic Coastal Human Impact dataset (SACHI)

<https://zenodo.org/record/492591>

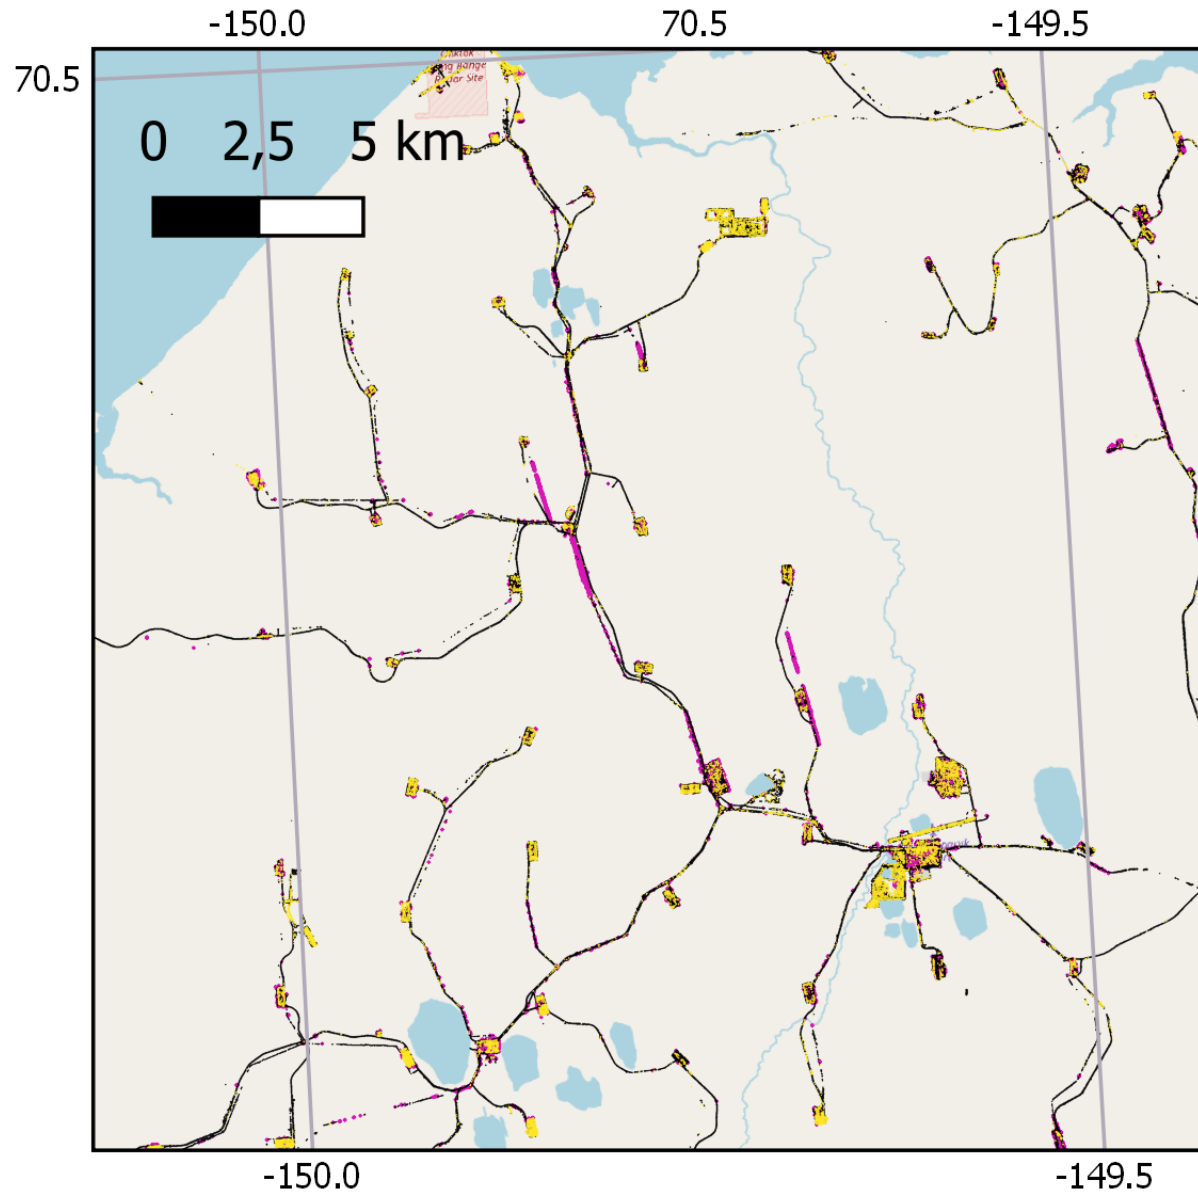

It consists of three shape files:

1. SACHI.shp - all identified objects with infrastructure/impact classes and auxiliary information (permafrost status and trends, nightlight radiance, vegetation zone, Normalized Difference Vegetation Index trends from Landsat, settlements names)
2. SACHI_100km_buffer - Buffer polygon (analyses extent)
3. SACHI_granules_acquisition_dates - processed Sentinel-2 granule extent polygons with dates of all used input data

SACHI class values:

- 1=linear transport infrastructure,
- 2=buildings (and other constructions such as bridges),
- 3=other impacted area (includes gravel pads, mining sites)

Prudoe Bay Oil field, Alaska

Salluit, Canada

SACHI classes

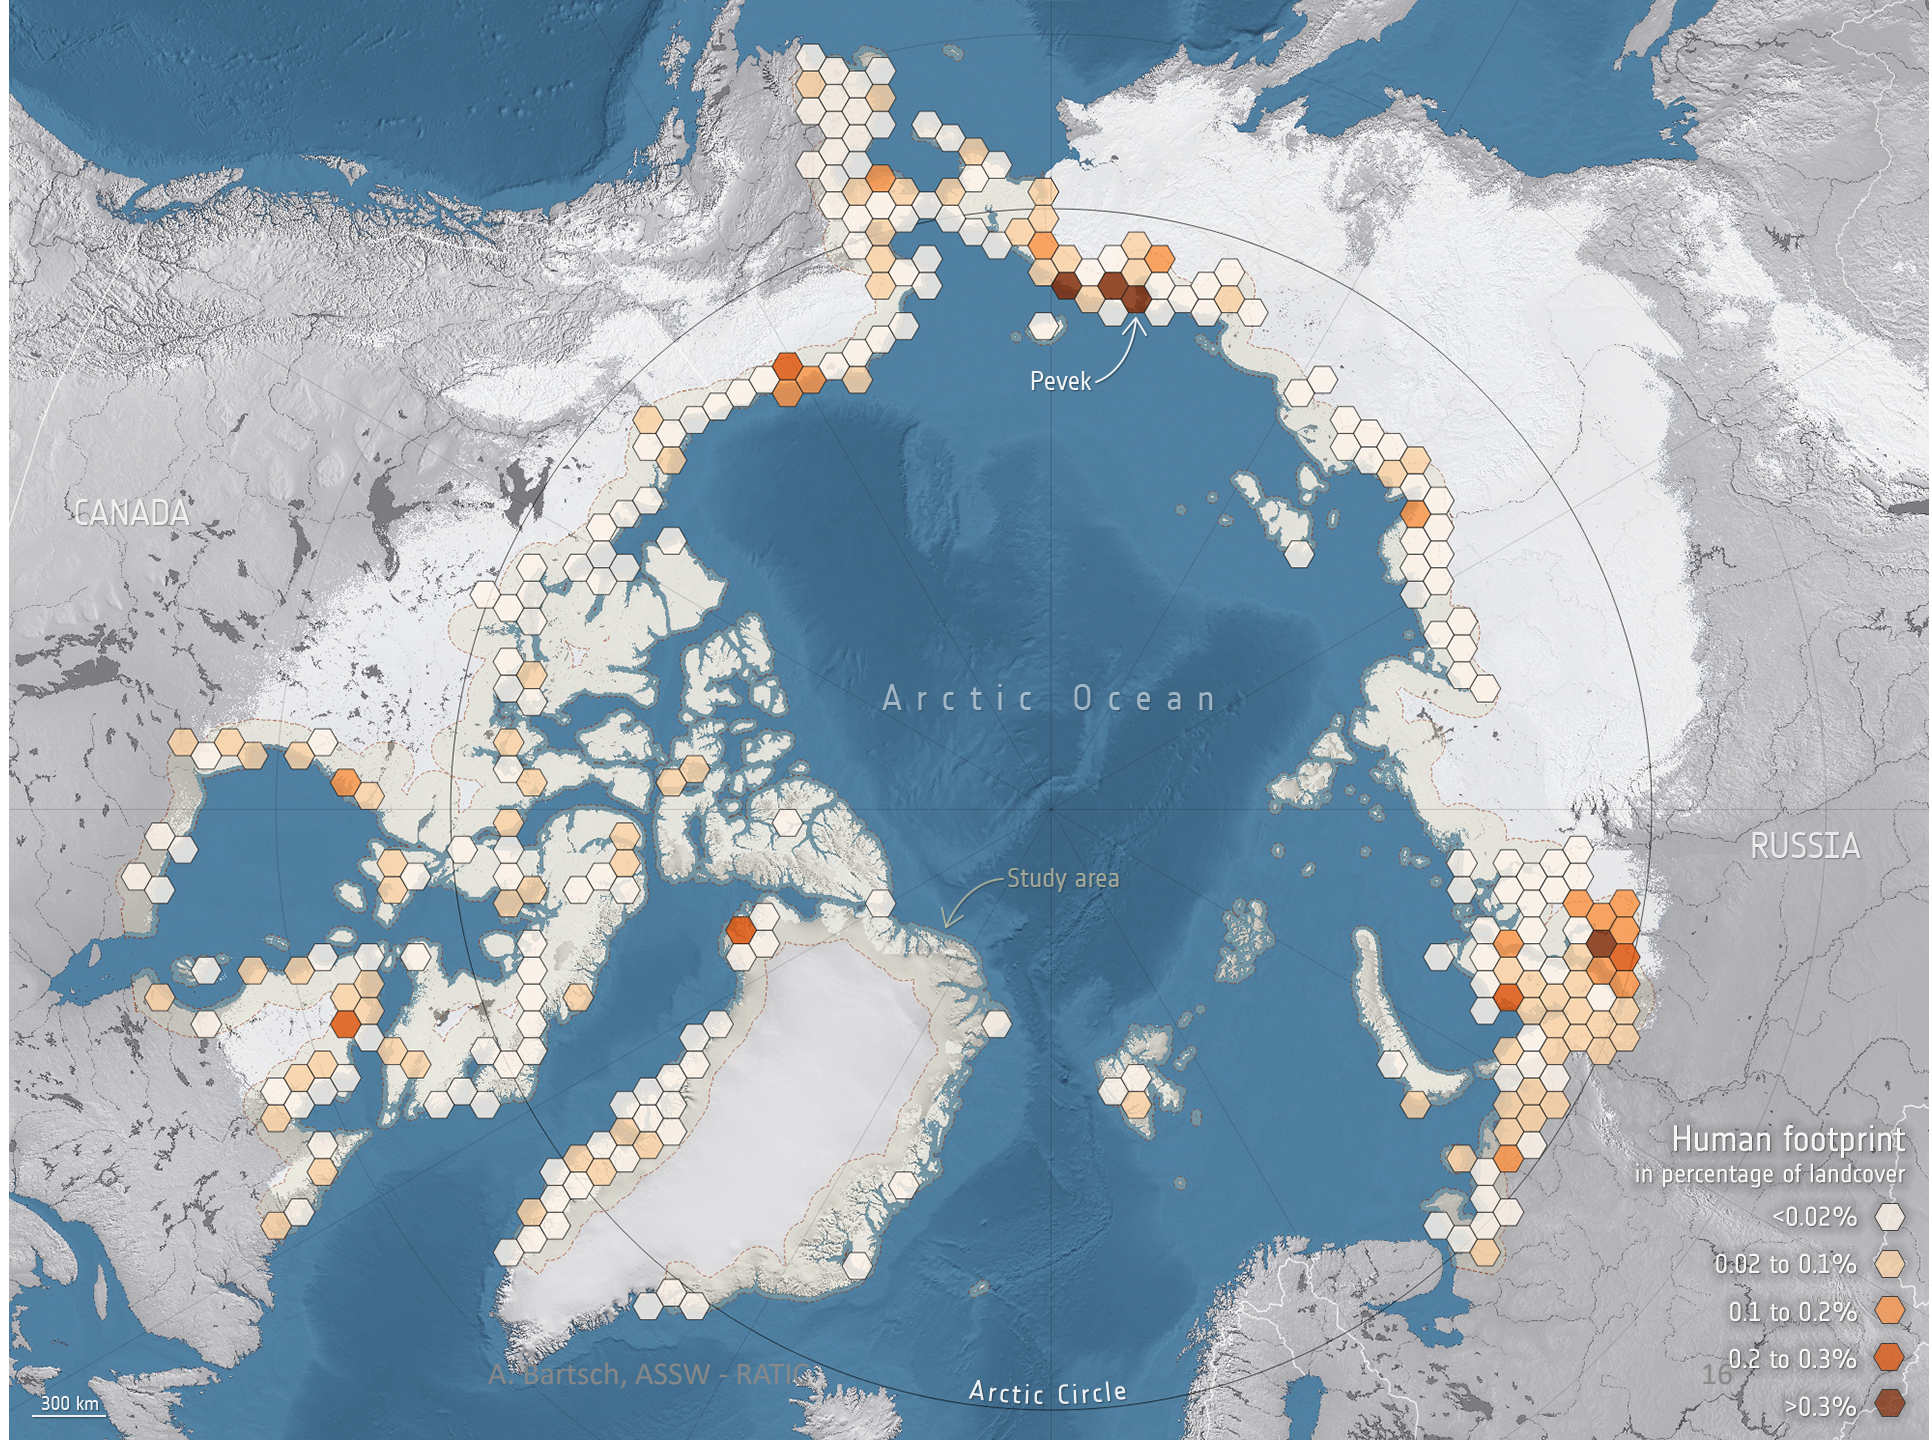

- roads
- buildings and other constructions
- other impacted area

'Human footprint' – within 100 km of the coast (permafrost areas only)

Roads, buildings & constructions, mining areas, gravel pads etc

Analyses extent

□ coastal zone - 100 km

Bartsch, Pointner, Nitze, Efimova, Jakober, Ley, Högström, Grosse, Schweitzer (2021), ERL

Gaps

- Other forms of infrastructure existing – social science discussion needed
- Landscapes are altered through vehicle tracks, geophysical surveys
- We need to include also the surroundings to capture the full impact, as available in local studies such as Reynolds et al. (2016), Walker et al. (in press)
- ...

Quantities

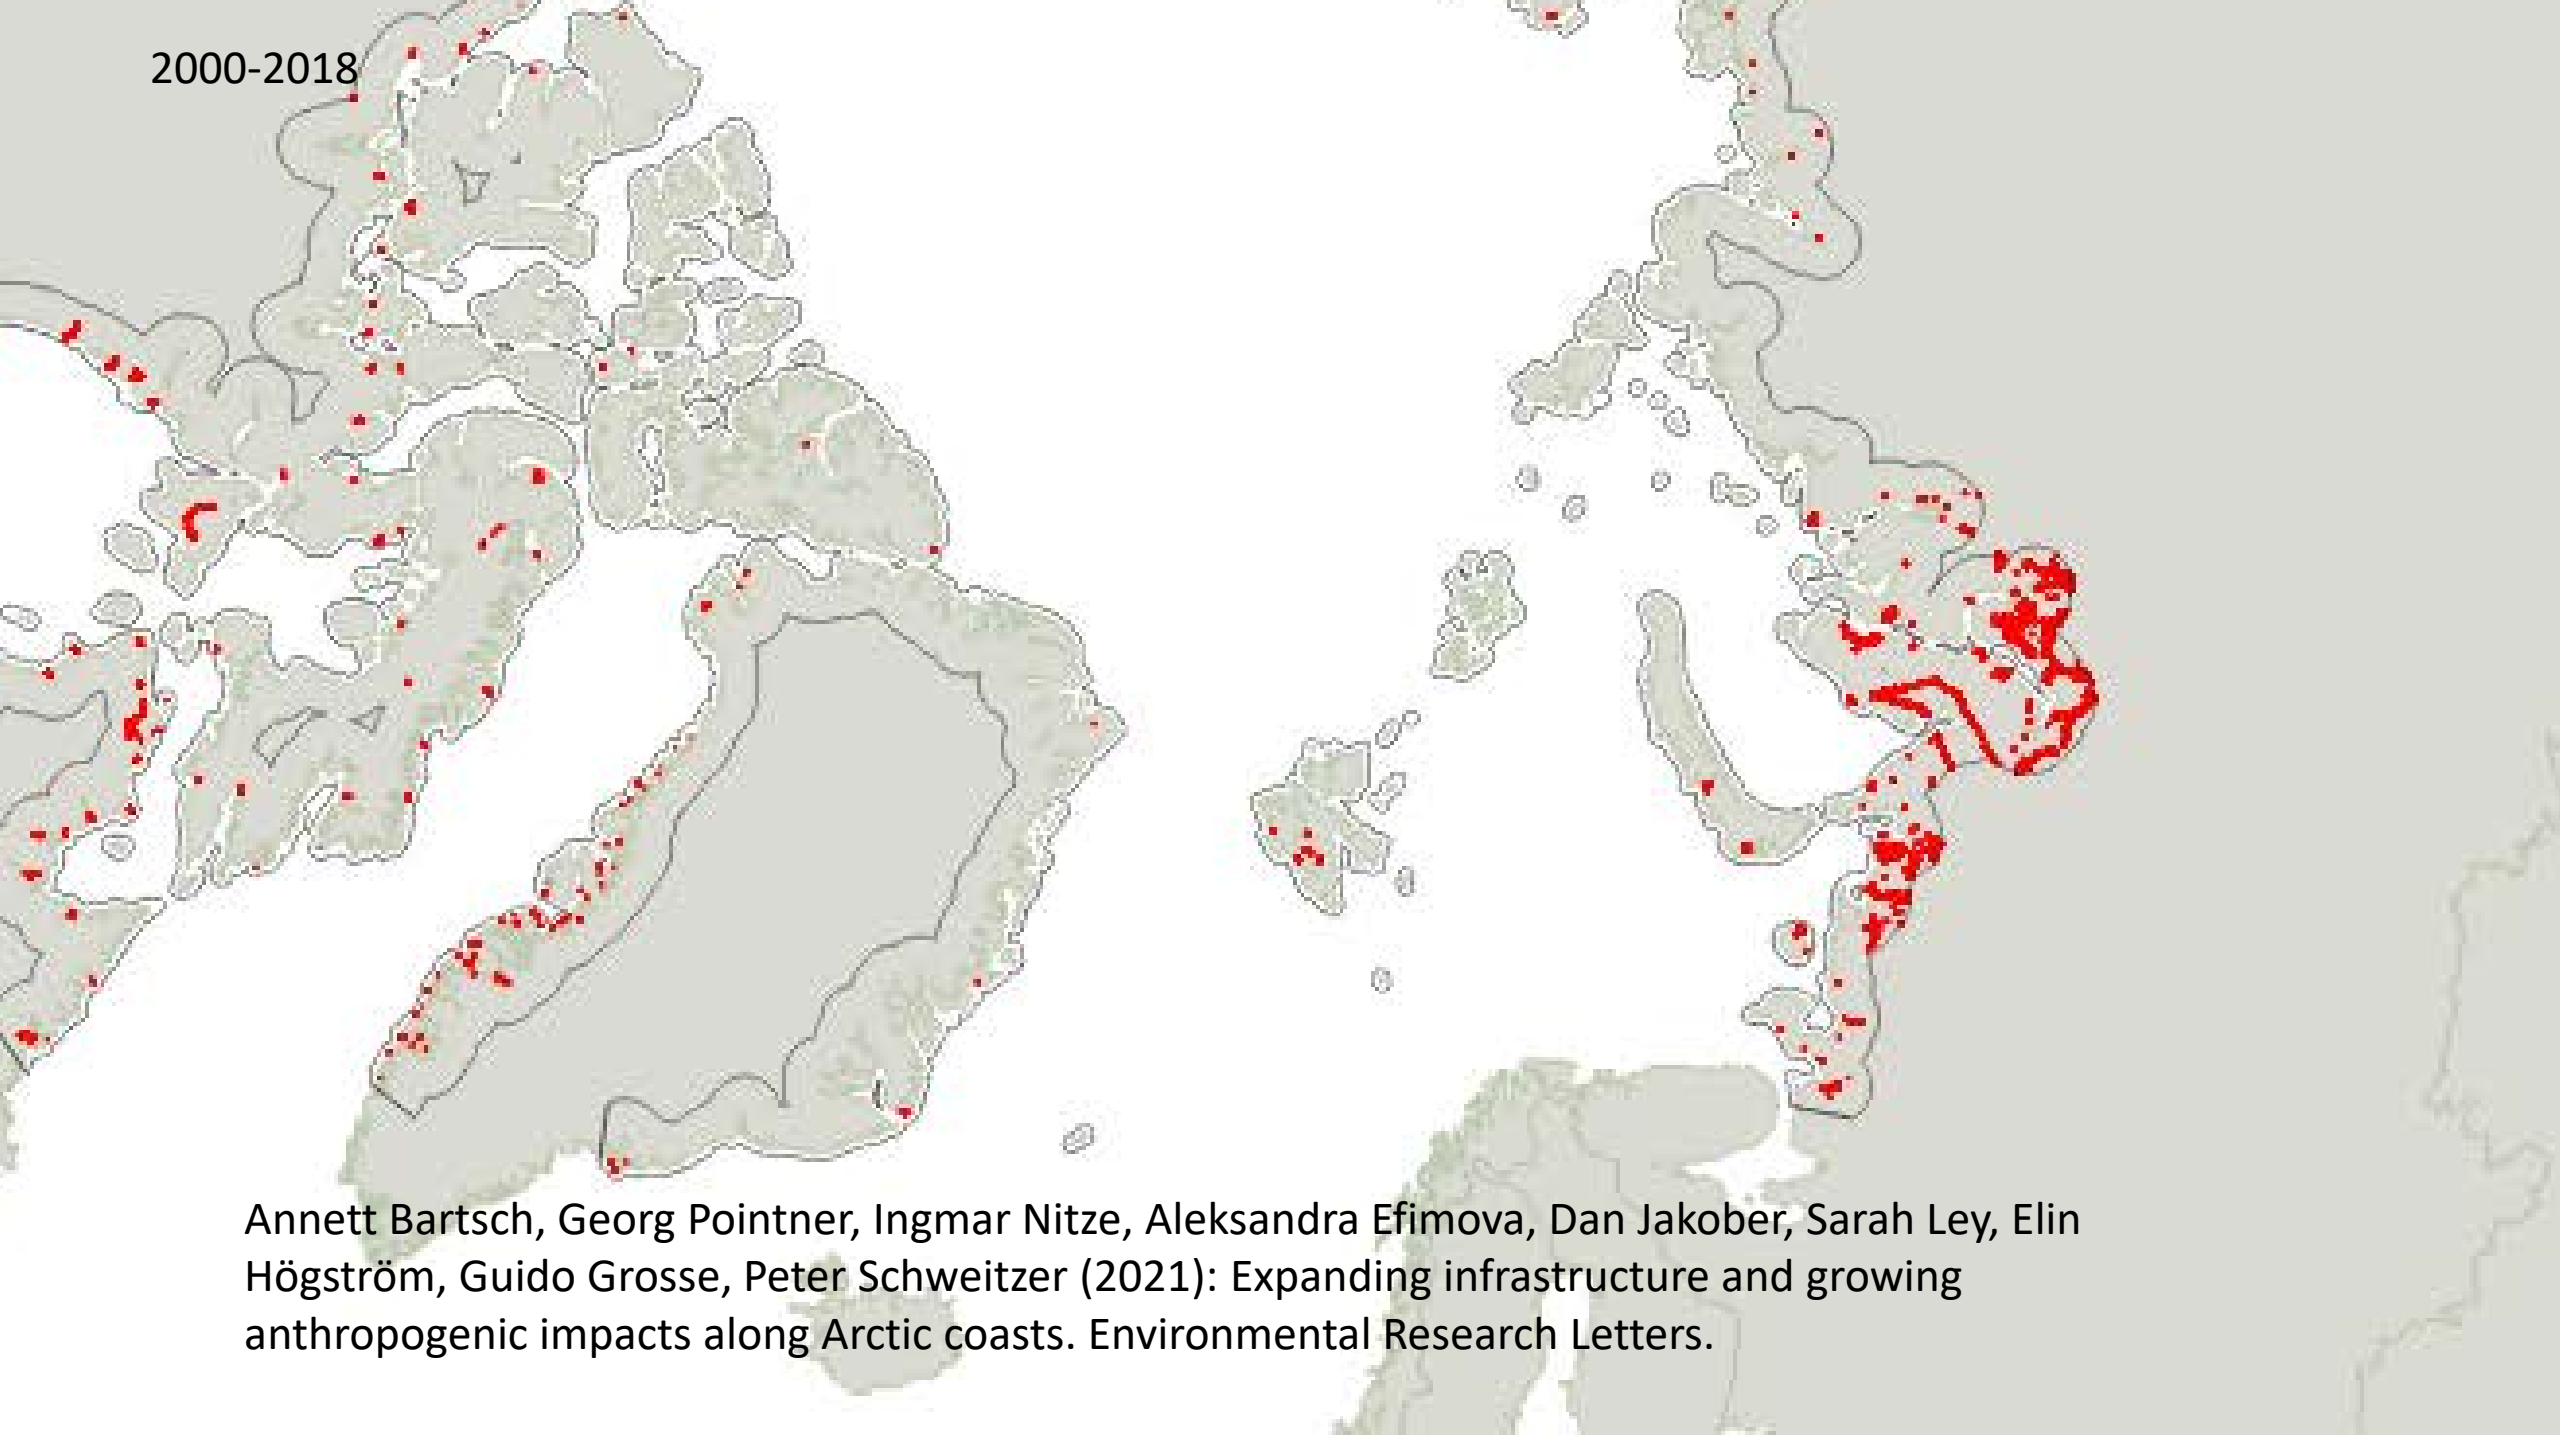

- *At least 15% correspond to new or increased detectable human impact since 2000*
- *55% of the identified human impacted area will be shifting to above 0°C ground temperature at two meter depth by 2050 if current permafrost warming trends continue at the pace of the last two decades*
- *SACHI contains 8% to 48% more information (human presence) than in OpenStreetMap. 221 (78%) more settlements are identified than in a recently published dataset for this region. 47% percent is not covered in a global night light dataset from 2016*

Conclusions

- *Sentinel-1/2 derived impacted areas provide more detail than any other currently available records for this region.*
- *Several examples for combination with other (coarser) satellite records demonstrate the utility*
- *First consistent account of human presence in the Arctic, but improvements required regarding e.g. classes, uncertainty characterization*
