Bulletin No. 86

REPORT OF THE INTERNATIONAL ICE PATROL IN THE NORTH ATLANTIC

Season of 2000

CG-188-55

Forwarded herewith is Bulletin No. 86 of the International Ice Patrol, describing the Patrol's services, ice observations and conditions during the 2000 season. After an unusually light year in 1999 in which only 22 icebergs found their way south of the 48th parallel north, 2000 once again challenged the Ice Patrol with a "normal" season. The first year of the new millennium saw 843 icebergs cross 48^o North to threaten the trans-Atlantic shipping lanes. The International Ice Patrol's efforts were once again successful in protecting vessels that heeded the posted limits of all known ice from collision with icebergs. Unfortunately, iceberg collision did claim a victim inside the limits. The *BCM Atlantic* was lost off the coast of Labrador in March after colliding with a small iceberg. Luckily, the crew was able to take to boats and all hands were successfully rescued. This latest casualty again reminds us just how dangerous a vessel/iceberg encounter can be. Mr. Brian T. Hill of the Institute for Marine Dynamics, National Research Council Canada has compiled a fascinating database of the over 560 iceberg collisions that have been documented in the North Atlantic over the past 200 years. This database builds nicely on a less comprehensive effort completed by Lieutenant Douglas W. Crowell and the Ice Patrol staff originally published as an appendix to Bulletin No. 59 documenting the 1973 season. While the International Ice Patrol does not typically include the works of other agencies in our *Annual Report*, Mr. Hill's work so appropriately aligns with the history, mission and core values of the Ice Patrol, that the opportunity to publish this fascinating documentation on the peril of icebergs at sea was irresistible and wholly appropriate. We extend our sincere thanks to Mr. Hill for the opportunity to present this intriguing article and historic database.

Introduction

This is the 86th annual report of the International Ice Patrol. It contains information on Ice Patrol operations, environmental conditions, and iceberg conditions for the 2000 season in the North Atlantic. Ice Patrol is supported by 17 member nations and conducted by the U. S. Coast Guard. Ice Patrol activities are delineated by U. S. Code, Title 46, Sections 738, 738a through 738d, and the International Convention for the Safety of Life at Sea, 1974. Ice Patrol was initiated shortly after the sinking of the RMS TITANIC on April 15, 1912 and has been conducted yearly since that time with the exception of brief periods during the two World Wars.

Commander, International Ice Patrol is under the operational control of Commander, Coast Guard Atlantic Area. IIP conducts aerial reconnaissance from St. John's, Newfoundland to search the southeastern, southern, and southwestern regions of the Grand Banks of Newfoundland for icebergs. IIP also receives iceberg location reports from ships and planes transiting its area of responsibility. We salute *M/V CSO Marianos* who provided the most ship reports during the 2000 season. IIP analyzes iceberg and environmental data at its Operations Center in Groton, Connecticut. IIP predicts iceberg drift and deterioration using a computer model and produces twice-daily iceberg warnings that are broadcast to mariners as bulletins and charts. IIP also responds to requests for iceberg information.

Vice Admiral John E. Shkor was Commander, U. S. Coast Guard Atlantic Area during the 2000 season. CDR Stephen L. Sielbeck was Commander, International Ice Patrol through 21 July 2000 when he was relieved by CDR Robert L. Desh.

For more information about International Ice Patrol, including iceberg bulletins and charts, see IIP's website at <http://www.uscg.mil/lantarea/iip/home.html>.

Summary of Operations

The 2000 ice year (1 October 1999 to 30 September 2000) marked the 86th anniversary of the International Ice Patrol which was officially established on 7 February 1914. Lines along 40°N, 52°N, 39°W and 57°W enclose IIP's operating area (Figure 1).

IIP's first Ice Reconnaissance Detachment of the year departed on 23 January 2000. IIP opened the 2000 iceberg season on 1 March 2000 and IRDs operated from Newfoundland every other week through 17 July 2000. IIP closed the season on 9 August 2000 and the post-season IRD concluded on 21 August 2000.

IIP's Operations Center in Groton, Connecticut analyzed 1,852 information reports from IRDs, merchant ships, Canadian Ice Service iceberg and sea ice

reconnaissance flights, and other sources (Figure 2). Of these reports, 749 contained ice information (Figure 3). These ice reports contained 7,903 reported targets, of which 2,632 individual targets were merged into IIP's iceBerg Analysis and Prediction System model (Figure 4).

Merchant shipping continued to provide the majority of reports received by IIP. In 2000, 256 ships from 48 different nations provided IIP with 1,445 reports or 78% of total reports (Figure 2). This demonstrates that the number of nations using IIP services far exceeds the 17 member nations supporting IIP under SOLAS. Furthermore, the merchant industry's continued active participation indicates the value placed on IIP's services. Appendix B lists the ships that provided information reports, including ice,

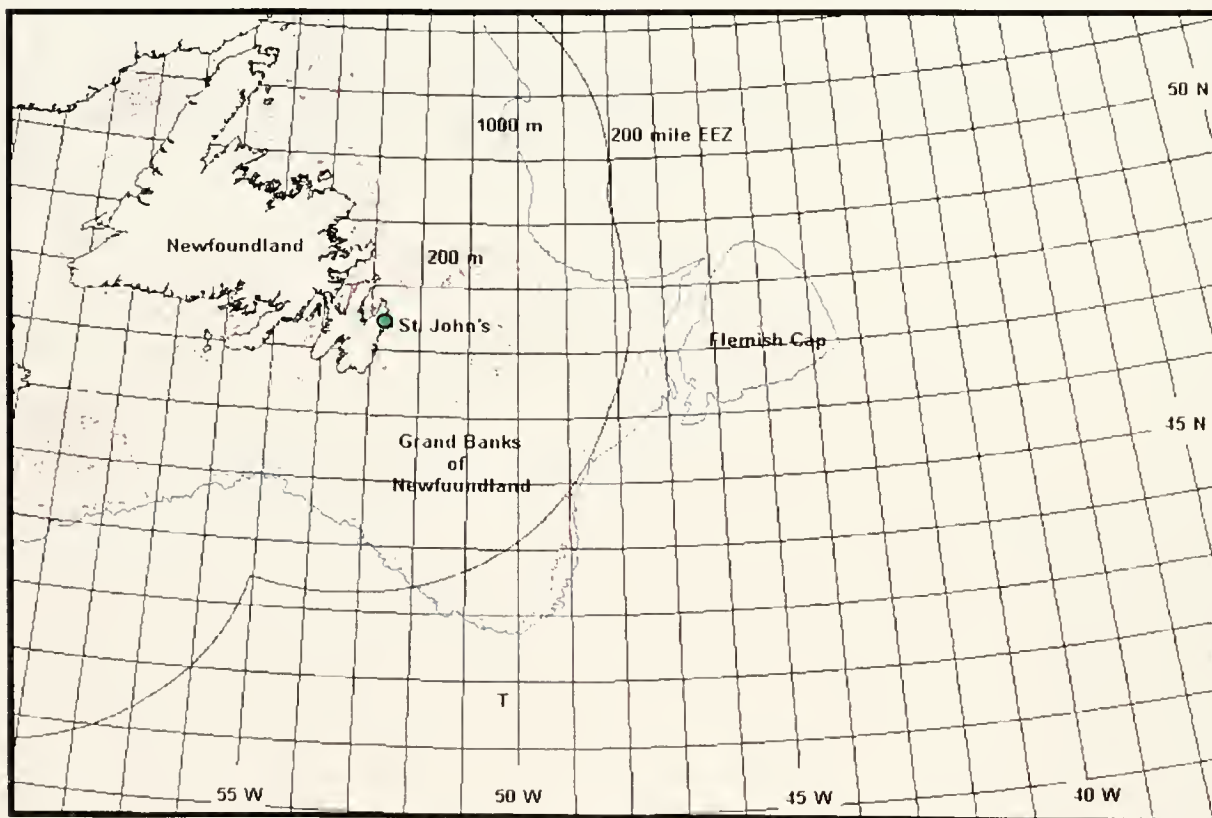

Figure 1. IIP's operating area 'T' indicates location of TITANIC sinking.

**Percentage of Total Reports
Out of 1852**

Figure 2. Sources of reports received in 2000, including ice, "no ice", and SST reports.

"no ice", stationary radar target, and sea surface temperature reports. In Appendix B, a single report may contain multiple targets. In 2000, the merchant vessel that provided the most reports was *M/V CSO Marianos*, submitting 77 separate reports. Though not all of the 1,445 information reports submitted by merchant vessels contained ice information, those that did (427 ice reports) still comprised 57% of the ice reports received by IIP (Figure 3).

The Canadian Government provided the next highest number of reports with 17.4% of total reports and 31.8% of the ice reports received by IIP (Figures 2,3). The Canadian Government category

Percentage of Ice Reports Out of 749

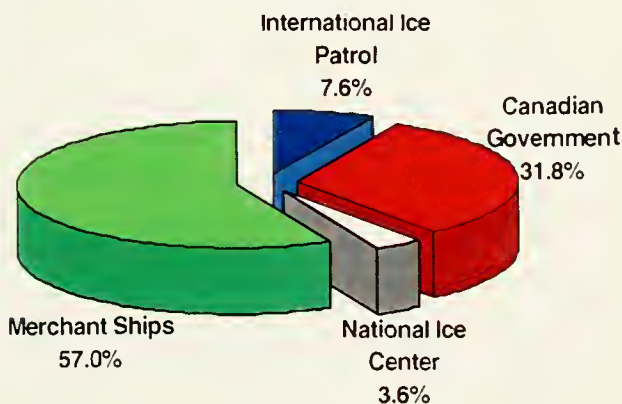

Figure 3. Sources of ice reports received in 2000.

encompasses reporting from the CIS reconnaissance airplane, contract reconnaissance flights by Provincial Airlines, HMCS vessels at sea, and coastal lighthouses. CIS conducts ice reconnaissance using a SLAR-equipped Dash-7 airplane, focusing primarily on sea ice. Provincial Airlines is a private company that provides reconnaissance services on contract to DFO throughout the year, to CIS from June through December and to the offshore oil industry. DFO flights by Provincial Airlines monitor fishing vessel activity, frequently carrying them into areas of high iceberg concentrations.

The reporting sources that detected the most icebergs are those that included aerial reconnaissance since this method allows for covering the most ocean area. The sources with the most targets merged into IIP's BAPS model were the Canadian Government with 40.3% and IIP with 23.5% (Figure 4). Due to the ability of aerial reconnaissance to cover a larger area in a shorter time, their reports usually contain multiple targets within the same report in comparison to ships that report fewer, if any, targets per report. IIP, which accounted for only 7.6% of ice reports, provided 23.5% of targets merged into the BAPS model. Ships, which accounted for 57% of ice reports, provided 8% of merged targets (Figures 3,4). Admittedly, data transfers from CIS to IIP (BAPS category)

**Percentage of Targets Entered
Into BAPS Model Out of 2632**

Figure 4. Original sources of all targets merged into BAPS model in 2000.

accounted for 27.2% of targets merged into the BAPS model (Figure 4). These transfers occur when targets cross the demarcation line between IIP and CIS operating areas at 52°N latitude. Therefore, although the BAPS category accounted for 27.2% of merged targets, it did not represent any reports submitted to IIP. The configuration of the BAPS model makes determining the original sources for targets of this type cumbersome. Consequently, no attempt is made to determine the original sighting source of targets transferred to IIP in this manner. The continued success and viability of the International Ice Patrol depends heavily upon all contributors of ice reports.

During the 2000 season, IIP flew fifty-four reconnaissance flights, detecting 1477 targets that were merged into BAPS. Because IIP is mandated to determine the limit of all known ice, IIP generally flies well offshore in the vicinity of the 1000-m bathymetric contour (Figure 1). The different areas covered by Canadian flights and IIP flights combine to form a complementary system that achieves good coverage of the entire Grand Banks area. This system allows for more complete and efficient coverage than either organization could achieve separately.

This combined system resulted in IIP and the Canadian Government detecting the majority of icebergs that set the limit of all known ice. IIP detected 45.1% of LAKI icebergs and the Canadian Government detected another 16.2% (Figure 5). Although IIP detected nearly half of the limit-setting icebergs due to the location of its reconnaissance, IIP also benefited significantly from the participation of ships of opportunity and from IIP's partnership with the National Ice Center. The merchant shipping industry was the original source of 28.9% of LAKI icebergs and NIC reported another 5.4%. The BAPS model generated information that accounted for 4.4% of LAKI icebergs.

To compare ice years in a historical perspective, IIP uses two different measurements. The first is the season's length in days (Figure 6). The second is the number of icebergs south of 48°N (Figure 7,8). This measurement includes both icebergs detected south of 48°N and those that were originally detected north of 48°N but were later predicted to have drifted south of 48°N. The icebergs south of 48°N measurement is generally preferred by IIP because it places the emphasis on icebergs that represent a significant hazard to transatlantic shipping. Additionally, the total number of targets

**Percentage of Limit Setting Icebergs
Out of 204**

Figure 5. Original sources of limit-setting icebergs in 2000.

Length of Ice Seasons Since 1995

Figure 6 Ice season lengths since 1995.

terms of season length and extreme in terms of the number of icebergs south of 48°N. A moderate season length is defined as between 105 and 180 days (Trivers, 1994). Extreme for icebergs is defined as greater than 600 icebergs south of 48°N (Trivers, 1994, Marko, *et al.*, 1994).

merged into the BAPS model is not used because IIP does not necessarily merge all reported targets. Sightings of targets outside IIP's area of responsibility and coastal icebergs are usually not merged as they represent little threat to transatlantic shipping. Thus, the total number of merged targets is not necessarily an objective and unbiased measurement from year to year.

Number of Icebergs South of 48°N by Month of 843 Total Icebergs

During the ice season, IIP prepares and distributes ice bulletins at 0000Z and 1200Z daily to warn mariners of the southwestern, southern, and southeastern LAKI. U. S. Coast Guard Communications Area Master Station Atlantic/NMF and Canadian Coast Guard Marine Communications and Traffic Service St. John's/VON are the primary radio stations responsible for the dissemination of ice bulletins. In addition, ice bulletins and safety broadcasts are delivered over the INMARSAT-C SafetyNET via the Atlantic East and West satellites. Another transmitting station for the bulletins is the Marine Communications and Traffic Services St. Anthony/VCM. IIP also prepares an ice chart depicting the 1200Z limit of all known ice for broadcast at 1600Z and 1810Z daily. U. S. Coast Guard Communications Area Master Station Atlantic/NMF and the National Weather Service assist with the transmission of the ice chart. On the European side of the Atlantic, Radio

Season length is intertwined with the number of icebergs south of 48°N, as Commander, International Ice Patrol considers the iceberg population when determining when to open or close the season. Various authors have discussed the appropriate measurement for ice season severity (Alfultis, 1987; Trivers, 1994; Marko, *et al.*, 1994). Comparing 2000 to the past five years and measuring the statistics against historical standards in various papers, 2000 was moderate in

Station Bracknell, United Kingdom/GFA and the German Federal Maritime and Hydrographic Agency stations Hamburg/DDH and Pinneberg/DDK transmit IIP's ice chart. Finally, both the bulletin and chart are placed on IIP's website.

IIP transmitted 324 scheduled ice bulletins in 2000. IIP measures the quality and timeliness of the bulletins it delivers to the mariner via the SafetyNET service, as this is the primary product for IIP's largest customer base. Of 324 total bulletins sent, 320 (98.8%) arrived at the system on time, or by 0000Z or 1200Z, respectively. Of the 324 bulletins, 323 (99.7%) were error free when delivered. The late deliveries were due primarily to human error on watch and the one erroneous bulletin was due to human error. IIP also sent 28 safety broadcasts during the 2000 season. IIP sends these special broadcasts whenever late-breaking ice information, received between the release of the 0000Z and 1200Z products, results in a LAKI change.

In 2000, IIP sent 324 ice charts via radiofacsimile. Of these, 317 (97.8%) were delivered on time and 323 (99.7%) were sent without errors. Late ice charts are defined as those for which the radio frequency start tone starts greater than one minute later than 1600Z or 1810Z. The primary cause of late ice charts was difficulty getting the signal from IIP through the line to CAMSLANT. The cause of the erroneous ice chart was operator error.

As in previous years, International Ice Patrol requested that all ships transiting the Grand Banks report ice sightings, weather, and sea surface temperatures via Canadian Coast Guard Radio Station St. John's/VON, U. S. Coast Guard Communications Area Master Station Atlantic/NMF or INMARSAT-C or INMARSAT-A using code 42. Ships are

encouraged to make ice reports even if "no ice" is sighted. Knowledge of where ice is not found is also very important to IIP. IIP tabulated the number of SST reports received during the 2000 ice season in Table 2.

IIP received information from the following sources during the 2000 ice year: Canadian Coast Guard Marine Communications and Traffic Service St. John's/VON; Canadian Coast Guard Ice Operations Center St. John's; Canadian Coast Guard Marine Communication and Traffic Service Halifax/VCS; Canadian Ice Service; U. S. Coast Guard Atlantic Area Command Center; U. S. Coast Guard Automated Merchant Vessel Emergency Response System; and U. S. Coast Guard Operations Systems Center. International Ice Patrol extends its sincere appreciation to all stations and ships that contributed reports during 2000.

Iceberg Reconnaissance & Oceanographic Operations

Reconnaissance Operations

International Ice Patrol formally begins its seasonal ice observation and Ice Patrol service when icebergs threaten primary shipping routes between Europe and North America. This usually occurs in February and extends through July, but Ice Patrol commences operations when iceberg conditions dictate. The 1992 season, the longest on record, ran for 203 days from March 7th through September 26th. Except during unusually heavy ice years, the Grand Banks of Newfoundland are normally iceberg free from August through January.

IIP utilizes a Coast Guard C-130 long-range aircraft equipped with a Motorola AN/APS-135 Side-Looking Airborne Radar and a Texas Instruments AN/APS-137 Forward-Looking Airborne

Radar to conduct iceberg reconnaissance. Reconnaissance flights are made on the average of five days every other week during the ice season. Coast Guard aircraft are the primary means of detecting icebergs that form the limit of all known ice. When iceberg reconnaissance is not being conducted, IIP relies on computer modeling to predict iceberg drift and deterioration and determine the LAKI.

The Ice Reconnaissance Detachment is a sub-unit under Commander, International Ice Patrol with Coast Guard Air Station Elizabeth City providing the aircraft platform. The IRD is deployed to observe and report ice and oceanographic conditions on the Grand Banks of Newfoundland. Oceanographic observations are used for operational and research purposes.

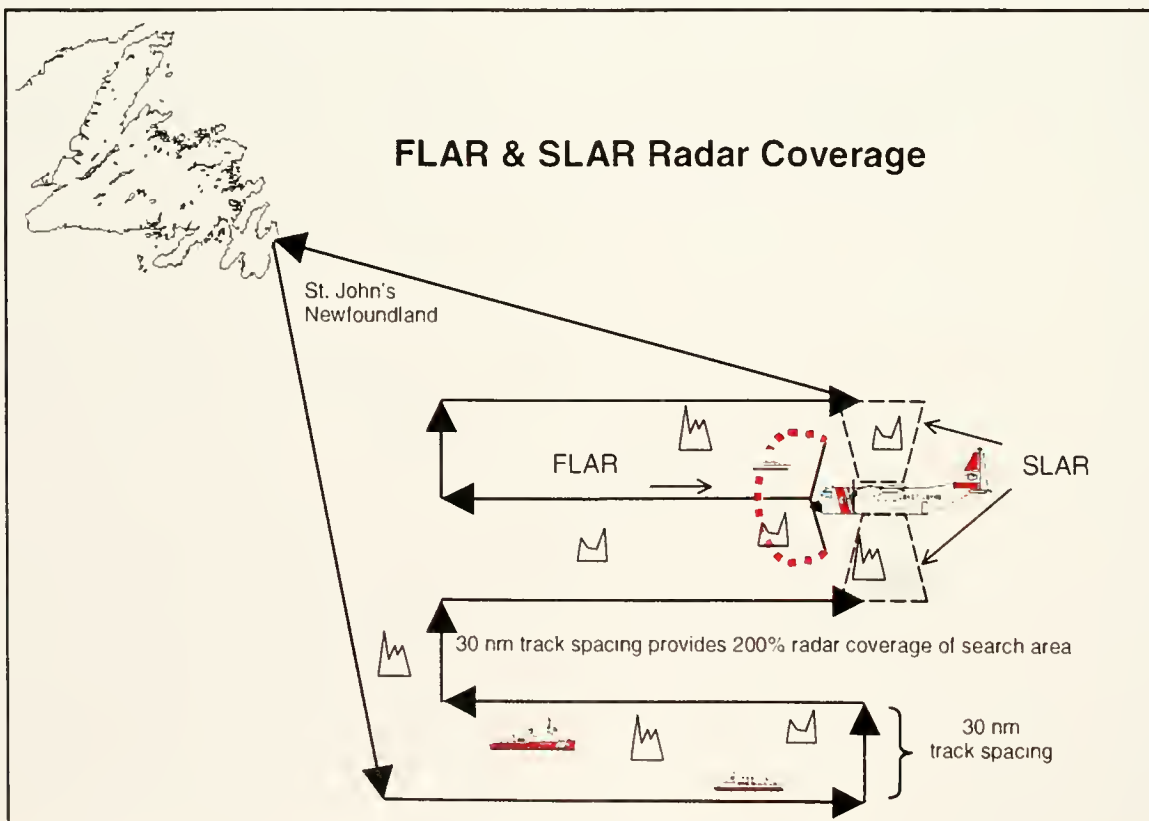

Figure 9. Radar reconnaissance plan.

Environmental conditions on the Grand Banks allow adequate visibility only 30% of the time during iceberg reconnaissance operations. Therefore, IIP relies heavily on its two airborne radar systems to detect and identify icebergs through cloudy and foggy conditions. IIP has used SLAR since 1983 and FLAR since 1993. The radar combination of SLAR and FLAR to detect and identify icebergs in pervasive low visibility conditions minimizes the flight hours required to accurately determine the LAKI. The radar combination allows IIP to use 30 NM track spacing compared to the 10 NM track spacing used prior to 1983. The C-130 with SLAR and FLAR covers a larger ocean area and still provides 200% radar coverage (Figure 9). IIP can currently cover 40,000 NM² at 30 NM track spacing in any visibility conditions. A detailed description of IIP's reconnaissance strategy is provided at <http://www.uscg.mil/lantarea/iip/FAQ/faq25.html>.

An IRD was deployed to IIP's base of operations in St. John's, Newfoundland for 128 days during the 2000 ice season (Table 3). IIP scheduled airborne reconnaissance every other week. IIP flew 99 sorties, 28 of which were transit flights to and from St. John's. 54 sorties were iceberg reconnaissance flights to determine the southwestern, southern and southeastern LAKI. Five sorties were research flights flown in support of a joint research project with the Canadian Ice Service to evaluate satellite radar imagery for iceberg detection. Twelve sorties were logistics flights from Coast Guard Air Station Elizabeth City to maintain and repair the aircraft. Figure 10 displays associated IIP flight hours for 2000.

IRD	Days Deployed	Patrol Sorties	Flight Hours
Pre	8	2	24.5
1	9	4	53.3
2	9	4	45.7
3	9	5	46.1
4	9	4	46.6
5	11	5	44.6
6	11	4	42.4
7	11	4	43.6
8	10	5	35.3
9	9	4	46.3
10	9	5	45.0
11	9	4	43.4
12	9	4	52.5
Post	5	0	15.0
Total	128	54	584.1

Table 3. 2000 IRD summary.

IIP used 584.1 flight hours in 2000, a 46% increase over 1999 (Figure 11). This increase was due to a moderate ice season in 2000 compared to no ice season in 1999 in terms of season length. Figure 12 compares flight hours with the number of icebergs south of 48°N latitude since 1986. This figure demonstrates that IIP expends a fairly consistent number of flight hours but the number of icebergs varies significantly. A few icebergs can extend the geographic distribution of the LAKI even with a low number of icebergs passing south of 48°N. IIP is often in the position of having to patrol a large ocean area with widely distributed icebergs.

Figure 10 2000 flight hours.

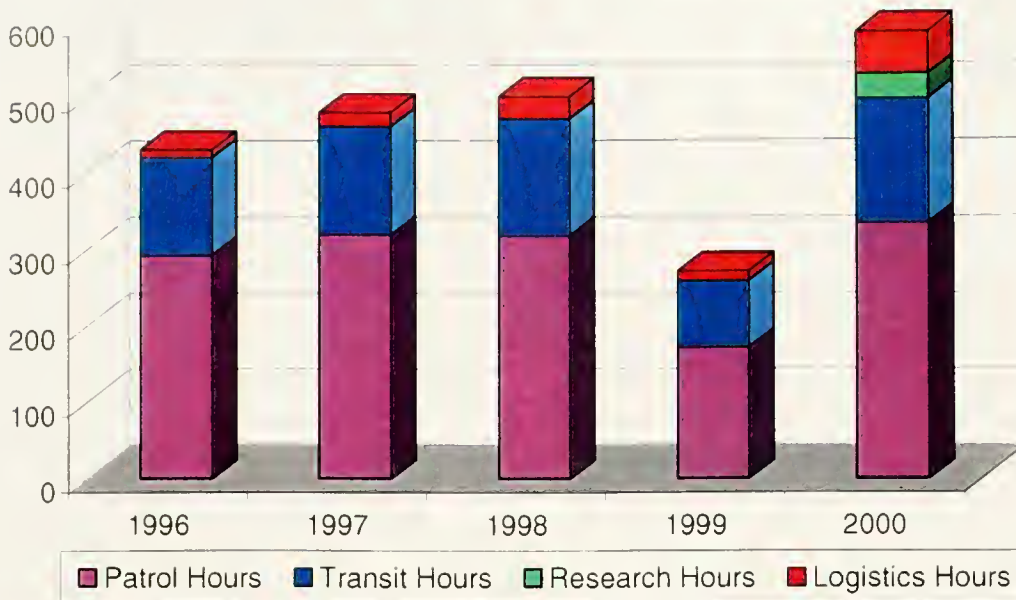

Figure 11 Breakdown of flight hours (1996-2000).

Figure 12. Flight hours versus icebergs south of 48 N.

Differentiating among types of targets on the Grand Banks is a continuous challenge for IIP reconnaissance. Visibility is frequently poor and targets are often identified solely from their radar image. Both SLAR and FLAR provide valuable clues about the identity of targets. However, in most cases, FLAR's superior imaging capability provides definitive target identification. Figure 13 displays the numbers and types of targets detected by reconnaissance patrols during the 2000 season. Of 2117 icebergs detected, 51% were detected and identified with radar only, demonstrating IIP's reliance on radar

identification. However, determining whether a radar target is an iceberg or a vessel is difficult with small vessels and small icebergs. The Grand Banks is a major fishing area frequented by fishing vessels ranging in size from 60 to over 200 feet. Small vessels and small icebergs sometimes present similar radar returns and cannot be differentiated. When there are no clear distinguishing features, the target is classified as a radar target.

Since 1997, the Grand Banks region has been rapidly developed for its oil reserves. In November 1997, Hibernia, a gravity-based oil production platform, was set in position approximately 150 NM offshore on the northeastern portion of the Grand Banks. Each year, there are several mobile drilling rigs in the Terra Nova and White Rose drilling fields on the Grand Banks. Increased development has increased air and surface traffic in IIP's area of responsibility, further complicating reconnaissance efforts. This emphasizes the need to pursue technological innovations in reconnaissance equipment and strategy.

Figure 13. Breakdown of targets detected by IRD in 2000.

Oceanographic Operations

Historically, IIP conducted extensive oceanographic surveys on the Grand Banks. Oceanographic operations peaked in the 1960's when the Coast Guard devoted substantial ship resources to collecting oceanographic data. Two factors combined to change the nature of IIP's oceanographic operations. First, increased competition among the various Coast Guard missions made it increasingly difficult for IIP to obtain ship resources. Second, there was a vast improvement in the capability and reliability of deployable oceanographic instruments.

IIP collects oceanographic data with satellite-tracked drifting buoys deployed by aircraft or ship and Air-deployed eXpendable BathyThermograph probes. The drifters, popularly known as WOCE (World Ocean Circulation Experiment) buoys, are drogued at a depth of either 15 or 50 meters and provide valuable current information. The historical current database used by IIP's computer model is modified weekly using the current information from the drifting buoys.

During the 2000 season, IIP deployed 13 satellite-tracked drifting buoys, seven from reconnaissance aircraft, and six from volunteer ships. Figure 14 shows composite tracks for the deployed buoys. Two buoy recoveries were planned but not attempted due to poor weather conditions. Drifter information is provided in IIP's 2000 WOCE Buoy Drift Track Atlas, available upon request.

AXBT probes are dropped to determine the water temperature profile. This information helps IIP determine the location of the Labrador Current, validate temperatures from satellite-tracked drifting buoys, and obtain precise SST measurements for numerical models. During the 2000 season IIP dropped 124 AXBT probes. Data was collected from 96 of the AXBT drops, a failure rate of 23%. Figure 15 shows the development of IIP's AXBT program since 1996. IIP awarded a contract in 1999 to replace the AXBT receiver with a more reliable system. The new system was tested and used operationally during the 2000 season. The results were encouraging but there is much room for improvement. More experience

with the new system is expected to reduce failures.

AXBT information is coded into a standard format and shared with the Canadian Maritime Atlantic Command

Meteorological and Oceanographic Centre, IIP's supplier of AXBT probes. Data is also sent to the U. S. Naval Fleet Numerical Oceanographic and Meteorological Center where it is quality controlled and redistributed via oceanographic products.

Figure 15 AXBT drops and drops with data collected (1996-2000).

Ice and Environmental Conditions

Introduction

Icebergs returned in large numbers to the transatlantic shipping lanes near Newfoundland in 2000, creating dangerous navigational conditions for mariners. Although the air temperatures in the region were generally warmer than normal and the sea ice cover less extensive and thinner than normal, International Ice Patrol counted 843 icebergs that passed south of 48°N latitude, the boundary below which icebergs are considered a threat to transatlantic shipping. This active iceberg season followed one of the lightest in IIP's history, with only 22 icebergs counted in 1999. This section describes evolution of the 2000 iceberg season and the environmental conditions it accompanied.

For record keeping purposes, the IIP ice year extends from October through September. The following month-by-month narrative of the progress of the 2000 ice season begins as sea ice began forming along the Labrador coast in mid-November 1999, and concludes in July 2000 as the last vestiges of the sea ice departed the Labrador coast. The narrative draws from several sources, including the Seasonal Summary for Eastern Canadian Waters, Winter 1999-2000 (Canadian Ice Service, 2000a); sea ice analyses (pages 22-30) provided by the Canadian Ice Service and the National Ice Center; the Integrated Global Ocean Services System Products sea surface temperature anomaly (Climate Data Library, International Research Institute for climate prediction at Lamont-Doherty Earth Observatory of Columbia University); and finally, summaries of iceberg data collected by IIP and CIS. The Biweekly Iceberg Charts section (pages 31-43) documents the LAKI on the first and 15th of each month during the season.

Comparing the 1999-2000 sea ice and iceberg observations to the historical record emphasizes the departures from normal and gives a greater appreciation for the variability of the ice distribution in the western North Atlantic. For sea ice, Sea Ice Climatic Atlas, East Coast of Canada, 1971-2000 (Canadian Ice Service, 2000b) provides a 30-year median of ice concentration at seven-day intervals for the period from 26 November through 16 July. Viekman and Baumer (1995) present an iceberg limits climatology from mid-March to 30 July based on 21 years of Ice Patrol observations from 1975 through 1995. They provide the extreme, median, and minimum extent of the LAKI for the period. Finally, the average number of icebergs estimated to have drifted south of 48°N for each month was calculated using 101 years (1900 through 2000) of IIP records.

The pre-season sea ice forecast (Canadian Ice Service, 1999), which was issued in early December, predicted the following:

- normal freeze-up,
- ice edge movement into the Strait of Belle Isle during late December,
- sea ice reaching the Avalon Peninsula the last week of February,
- maximum extent of the sea ice at the end of March, and
- retreat at a slower pace than usual due to predicted lower than normal spring air temperatures.

November – December 1999

The fall and early winter freeze-up in 1999 began normally. By the end of November, new ice had formed in the bays and inlets along the Labrador coast north

of Hamilton Inlet and there was new ice near Cape Chidley, Labrador's northernmost point. By mid-December, new ice was present along the Labrador coast and had formed in the Strait of Belle Isle. By late December, the sea ice extent was slightly ahead of normal.

January 2000

There were two distinct sea ice growth and weather regimes in January. During the first half of the month, ice growth proceeded at a faster than normal pace both in Labrador and east Newfoundland waters. This was due in part to below normal air temperatures and moderate northwesterly winds in Labrador. The second half of January was a particularly stormy period in the western North Atlantic, and several of the storms moved up through Labrador to the Davis Strait area (Bancroft, 2000a). As a result, moderate southwest winds and mean air temperatures 3°C above normal dominated the southern Labrador coast and east Newfoundland waters. The elevated air temperatures and ice destruction brought about by the gales caused ice growth to stagnate. By month's end, the sea ice extent in east Newfoundland waters was about a week behind normal, with a less than normal ice thickness.

During the last week of January, Ice Patrol deployed its pre-season Ice Reconnaissance Detachment. The intent of the survey flight was to monitor the progress of icebergs toward the Grand Banks and to help determine the start date for the season. An iceberg survey on 24 January flew near the edge of the sea ice along the Labrador coast south of 57°30'N and found 79 icebergs. On the same day, a CIS reconnaissance flight found 21 icebergs within the sea ice along the Labrador coast south of 54°N. Thus,

based on this limited aerial ice reconnaissance, the January population of icebergs appeared sparse. No icebergs passed south of 48°N during the month.

February

Newfoundland was dominated by moderate westerlies due, in large part, to a series of low pressure systems that passed through the province. During the first half on the month, air temperatures were about 2°C greater than normal in northern Newfoundland and near normal elsewhere. The mid-month ice extent and thickness were slightly less than normal. During the second half of the month, the mean air temperature in all of Newfoundland was 1° to 2°C above normal. Due to the prevailing westerlies during February, the eastern sea ice limit was slightly greater than normal, while both the southern ice extent and thickness were less than normal.

Ice Patrol began routine aerial reconnaissance for the 2000 ice season with the deployment of IRD #1 on 10 February 2000. From 10 to 13 February, IIP, CIS and Provincial Airlines conducted extensive aerial surveys of the iceberg population from 47°N to 60°N. Five flights, including concurrent sorties by two IIP aircraft, provided excellent spatial and temporal coverage. The surveys, which enjoyed good visibility, documented a population of approximately 300 icebergs, almost all within the sea ice (Figure 16). Despite good visibility, it is likely that there were more than the nearly 300 icebergs counted, for finding small icebergs in areas of heavily ridged sea ice is difficult, particularly in low light conditions. Although no icebergs passed south of 48°N during February, it was clear there was a large population of icebergs not far to the north, and the early part of the 2000 season would be active.

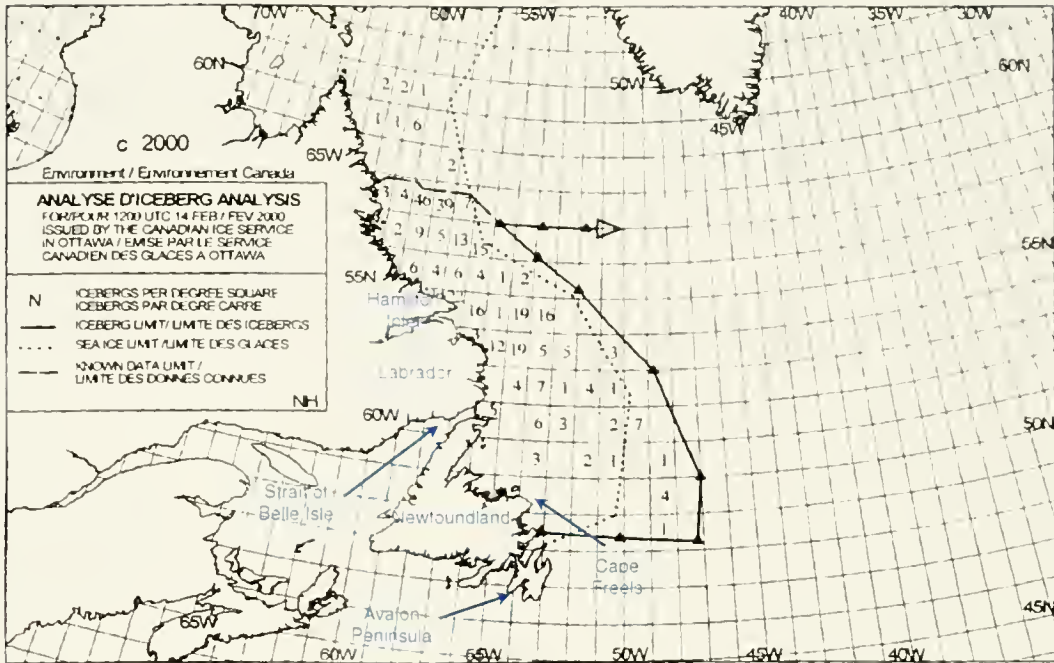

Figure 16. Iceberg distribution on 14 February 2000 from the iceberg analysis issued by the Canadian Ice Service. There are approximately 340 icebergs shown on this plot.

March

In March, low pressure systems continued to cross Newfoundland frequently, resulting in moderate winds that were primarily from the southwest in the south and central part of the island, and moderate northeast winds in the northern part. Across the entire island, the mean air temperature was warmer than normal for the entire month, 3.5° to 5°C during the first half of the month and 1° to 1.5°C in the second half. Labrador was also experiencing above normal mean air temperatures, particularly in the north where they were 3° to 5°C above normal for the entire month.

The eastern and southern limits of sea ice in east Newfoundland waters grew slowly during the first half of March. By mid-month, the southern and eastern sea ice extent was less than normal, and the ice was looser and thinner than normal. Throughout the remainder of the month, the ice edge changed very little, and, by

month's end, the sea ice extent was slightly less than normal.

On 1 March, Ice Patrol formally opened the 2000 ice season. The mid-month distribution of icebergs was about at the median for the southern extent and slightly less than the median for the easterly extent. The first month of the season was very active, with an estimated 286 icebergs drifting south of 48°N, well above the 101-year average of 61 for the month. In March, more icebergs passed south of 48°N than in any other month of the 2000 season. Most frequently (73 of 101 years), the busiest month of an iceberg season is April or May.

April

During the first half of April, Labrador's south coast and east Newfoundland waters experienced moderate southwest winds and mean air temperatures 2° to 5°C warmer than normal. This pattern was caused by a

ridge of high pressure in the central North Atlantic, which steered the tracks of the storms leaving the U. S. coast in early April to the Labrador coast. By mid-month, the blocking high had weakened and, for the remainder of April, the region experienced light to moderate west winds and near normal air temperatures.

The persistent offshore winds in early April created a vast near-shore lead that extended southward from Hamilton Inlet to the southern ice limit near Cape Freels, Newfoundland. In some places the lead was over 50 NM wide. Warmer than normal air temperatures in the early part of the month hastened the sea ice retreat both along the Labrador Coast and in east Newfoundland waters. By mid-month, ice retreat was 3 to 4 weeks earlier than normal in both areas. Although ice destruction slowed somewhat during the second half of the month, the retreat was 2 to 3 weeks ahead of normal at the end of April. Aside from a few, isolated small patches, there was no sea ice south of 51°N. Thus, the icebergs that threatened transatlantic shipping lanes no longer had the protection sea ice cover affords.

The mid-month distribution of icebergs was at the 25th percentile for the southern limit and about median for the eastern limit. In April, 239 icebergs were estimated to have drifted south of 48°N; the average for the month is 120.

May

Early May was characterized by light to moderate north winds and 1.5° to 2.5°C colder than normal mean air temperatures in both Labrador and Newfoundland. Both areas were dominated by light to moderate southwest winds and near normal air temperatures during the second half of the month.

The sea ice retreat continued to be well ahead of normal, by about 2 weeks, in both Labrador and Newfoundland. By mid-month, the only appreciable sea ice concentration near Newfoundland was in the Strait of Belle Isle and along the northern arm of Newfoundland. Sea ice destruction continued at a rapid rate, but it lingered in the vicinity of the Strait of Belle Isle until 26 May, when the Strait was declared safe for marine traffic. By 31 May the southern extent of the sea ice had retreated to 55°N.

The mid-May iceberg limit was at the median for both the southern and eastern limits. An estimated 212 icebergs drifted south of 48°N in May, while the average for the month is 147. In the 101-year average, May is the busiest month of the year for IIP in terms of number of icebergs passing south of 48°N. In 2000, the number, while higher than normal, declined from the two previous months.

On 24 May, the westernmost sighted iceberg during the 2000 ice season was seen by a Canadian reconnaissance flight at 50°00'N and 56°40'W. The westernmost drifted iceberg was at 49°58'N and 56°47'W on 29 May 2000.

June

Both the southern and eastern iceberg limits were at the median in mid-June. In June, 65 icebergs were estimated to have drifted south of 48°N; the average is 87. By month's end the southern limit had retreated so that it was between the median and the 75th percentile and the eastern limit was near the median.

The southernmost sighted and drifted iceberg was seen by an IIP reconnaissance flight on 8 June at 41°12'N and 47°56'W.

July

In mid-July both the southern and eastern iceberg limits were near median extent. In July, 41 icebergs were estimated to have drifted south of 48°N; the average is 31. The last IRD deployed from 12 to 20 July and found 64 icebergs. The last of the sea ice departed the coast of Labrador during the final week of July.

On 7 July, the easternmost observed iceberg was seen at 48°00'N and 38°00'W. Four days later, on 11 July, the same iceberg was estimated to have drifted to 48°05'N and 37°25'W, the easternmost modeled iceberg drift during the 2000 iceberg season. By month's end the iceberg limit in the south was near the median, however, there were only two isolated icebergs setting the limit. The eastern limit was well west of the median, at about the 75th percentile. Part of the reason for the rapid retreat of the iceberg limit was warmer than normal sea surface temperatures throughout the area. The

July SSTs were 1° to 2°C above normal on the northeast Newfoundland shelf and along the southern Labrador coast and over 2°C warmer than normal over most of the Grand Banks (Figure 17).

August

The rapid iceberg destruction continued into August, with 2.5°C warmer-than-normal SSTs throughout the waters east of Newfoundland and southern Labrador. IIP closed the 2000 iceberg season on August 9, at which time there were only scattered icebergs south of Hamilton Inlet.

Summary

From mid-January through the end of April, air temperatures in Labrador and Newfoundland were warmer than normal. This created unfavorable conditions for ice growth and accelerated ice retreat once the maximum had passed.

Figure 17. Mean sea surface temperature anomaly (blended from ship, buoy, and bias-corrected satellite data) for July 2000. (NOAA NCEP EMC CMB GLOBAL sea surface temperature anomaly product from IRI/LDEO Climate Data Library)

Although sea ice arrived somewhat earlier than normal in east Newfoundland waters, the maximum southern extent, eastern extent, and thickness were less than normal for 2000. A large shore lead formed in mid-April and persisted throughout the sea ice retreat from east Newfoundland waters, which proceeded two to three weeks ahead of normal. The pre-season sea ice forecast proved to be accurate for the early part of the season, including the progress of the ice edge to the Avalon Peninsula. However, the warmer than normal air temperatures caused a less extensive sea ice distribution and earlier retreat than predicted.

Icebergs arrived on the Grand Banks in March, a month later than normal. However, the first two months of the season were the busiest for IIP, with over 60% of the season's icebergs passing south of 48°N in March and April. The normal pattern is one of a steady monthly increase in the number of icebergs passing south of 48°N, building to a maximum in May, after which it declines (Figure 18). This pattern is evident in both the entire IIP record (1900-2000) and the era of modern

airborne radar reconnaissance (1983-2000).

Classifying the severity of the 2000 iceberg season is not straightforward. Indeed, there are several ways to classify iceberg season severity. The simplest and most popular indicator uses the number of icebergs that pass south of 48°N. Ice Patrol estimated that 843 icebergs passed south of 48°N in 2000, which is well above the mean of 479 for the 1900 to 2000 period. This places the 2000 iceberg season in the extreme category according to the iceberg season severity classes developed by Trivers (1994). However, fewer icebergs passed south of 48°N than the mean for the modern reconnaissance era, which is 1005. Season length, which measures the number of days IIP provided formal ice warnings to mariners, is also a useful indicator of season severity. The 2000 iceberg season length was 162 days, which according to Trivers (1994) classifies it as an average length season. Thus, overall, the 2000 season should be viewed as having been an average season, rather than extreme.

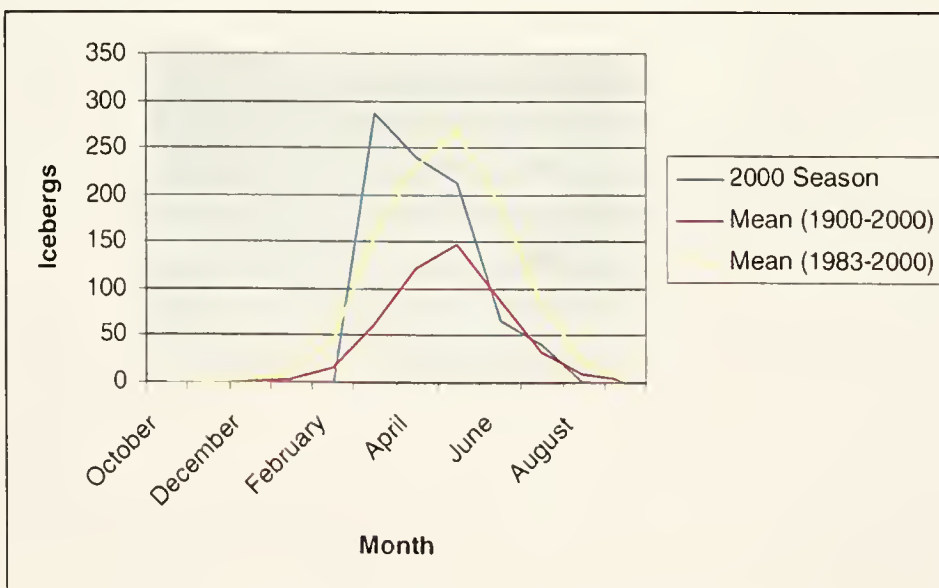

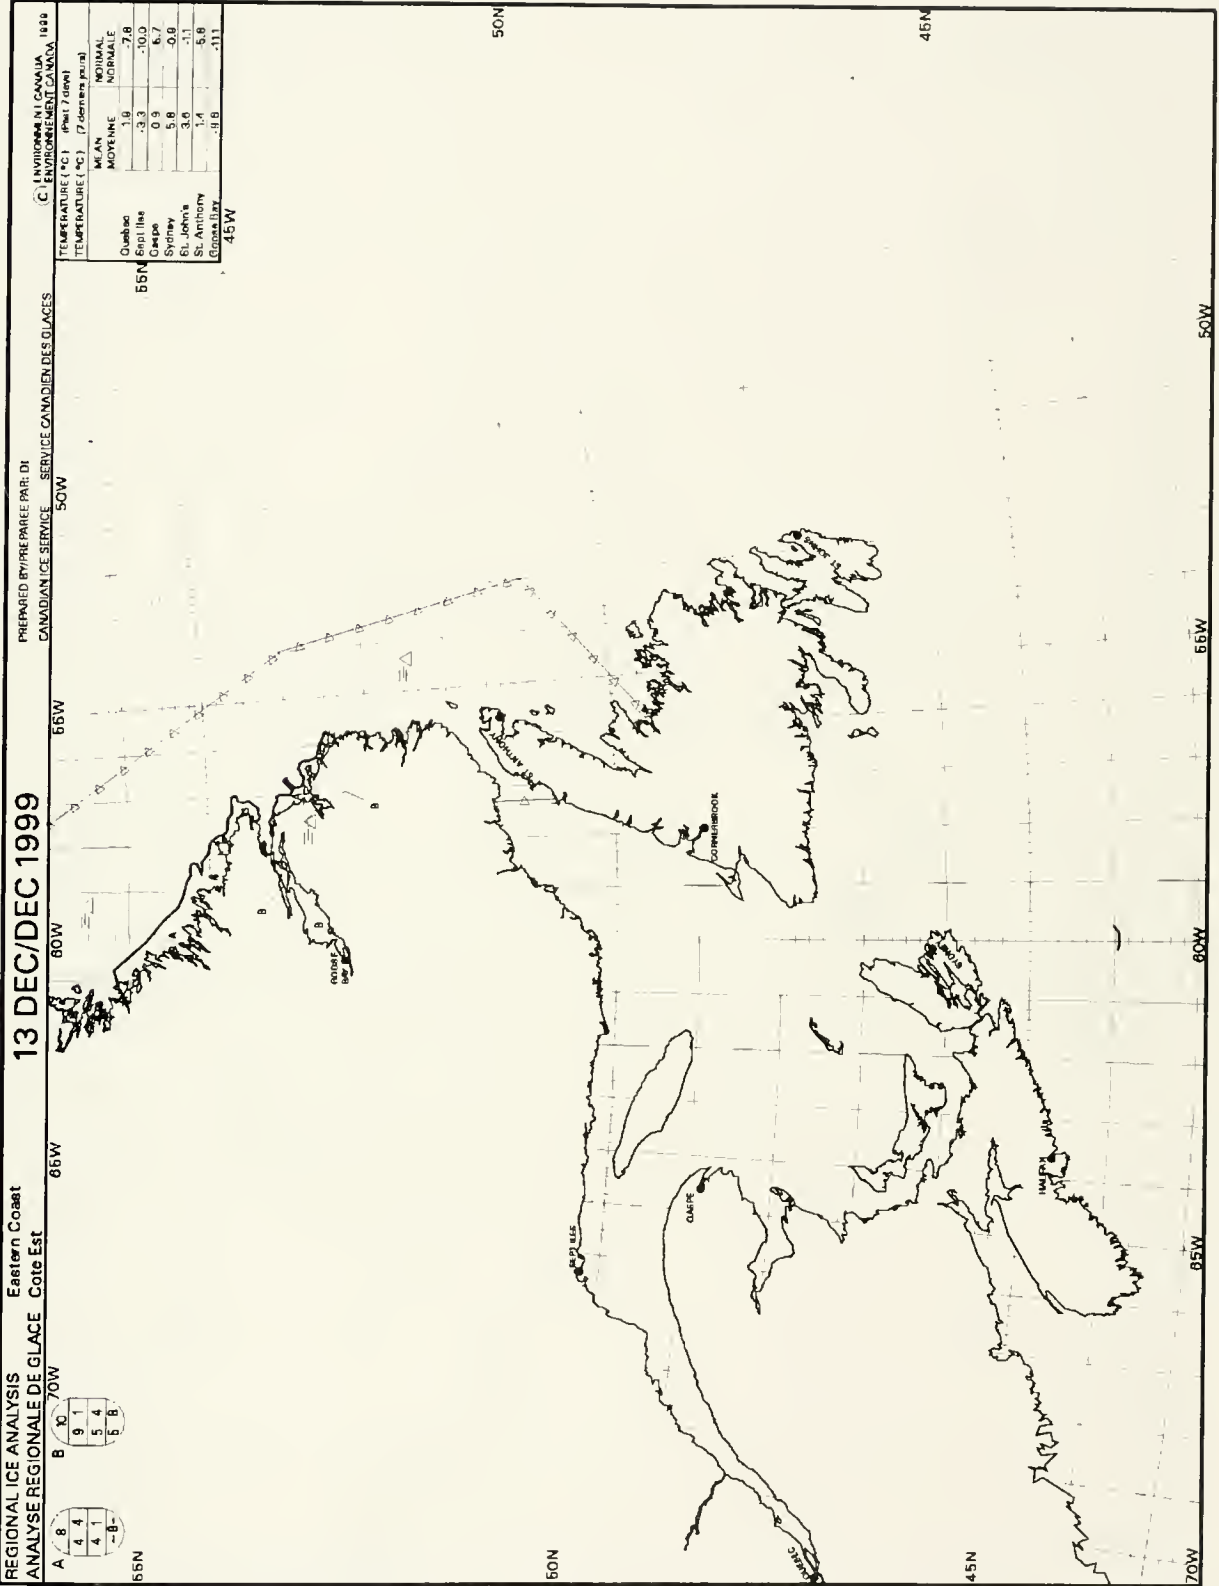

Figure 18. The distribution by month of the number of icebergs that passed south of 48°N for the 2000 season, the mean for the entire IIP record (1900-2000), and the mean for the era of modern airborne radar reconnaissance (1983-2000).

2000 Fax Chart Reception Project

MST3 Jonathan Dale and LT Christopher Strong

The International Ice Patrol strives to locate and track icebergs south of 52°N that may pose a threat to North Atlantic mariners. Ice Patrol then provides the Limit of All Known Ice (LAKI) to the mariner with the Daily Radiofacsimile (fax chart). This is broadcast from three different locations around the North Atlantic on 10 different high frequencies.

During the 2000 ice season the International Ice Patrol initiated the Fax Chart Reception Project to determine the quality of the reception received by our primary customer, the North Atlantic Mariner. In order to conduct the analysis the International Ice Patrol requested that mariners send copies of IIP's HF fax charts they received while underway. The copies were to be annotated with the reception position, time, and frequency. While IIP monitors the accuracy and quality of the HF fax chart at every transmission, the real goal of the project was to determine the quality of the reception received by our primary customer, the mariner. The response from the maritime community was good, and we received 195 different fax charts from 27 individual vessels (Table 3). To analyze the results, the faxes were first sorted according to the quality of reception. Then the position of receipt was plotted and the frequency of reception was noted.

The position and frequency of reception for fax charts received covered an enormous area from Germany to Puerto Rico. However, in order to focus our analysis efforts, IIP decided to narrow the analysis down to a region more representative of our area of operations. The area that we chose to examine extends north from 35°N to 59°N and west from 25°W to 65°W. As a result our sample size was reduced by more than half as only 79 charts were received within this area. Nonetheless, this represents a significant number of charts covering the major shipping routes in the North Atlantic.

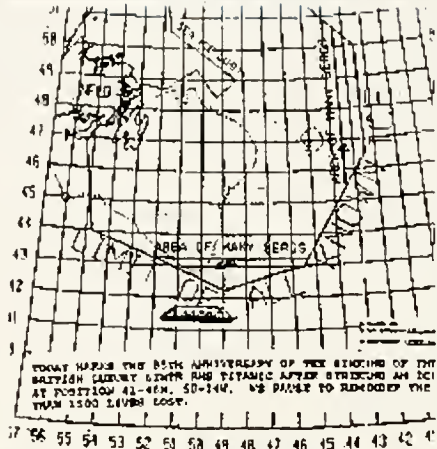

The quality of reception analysis was conducted by binning the charts into five categories shown in Figure 1. In four of the five (1 through 4) categories the LAKI was readable, although in Category 4 it was difficult. The fifth category was so poor that the information was incomplete or entirely unreadable. Table 1 shows the number of fax charts in each reception group within the analysis region.

Fax Chart reception rating scale

1. Best Reception

2. Good Reception

RECEPTION QUALITY IN SAMPLE GROUP

BEST	10
GOOD	21
FAIR	23
READABLE	21
POOR	4

Table 1. Quality of fax charts returned within the analysis region.

The data were also examined to determine the most popular frequencies. The results indicated the preferred frequency was 12750 MHz with 53% of the population (Table 2). This is the highest frequency at which the International Ice Patrol broadcasts its fax chart. The 13882.5 MHz chart is broadcast from Germany by the German Ice Service, and therefore would be expected to carry the farthest. It should be noted that other agencies also broadcast this product at high HF frequencies as well. It is noteworthy that, in general (83% of the charts), three major frequencies are used by the mariner: 9110 MHz, 12750 MHz, & 13822.5 MHz (Table 2).

Figure two shows the geographical distribution of the returned fax charts. The 13822.5 MHz frequency is the long HF fax chart broadcast from Germany, and was found principally on the eastern edge of the study area. The 9110 MHz frequency distribution showed that it was mainly copied West of 47°W since it is a lower HF frequency transmission. Finally, the 12750 MHz frequency was evenly distributed throughout the rest of the study area.

FREQUENCIES USED / PERCENT

<u>Percent</u>	<u>Frequency</u>
53%	12750 MHz
20%	9110 MHz
10%	13882.5 MHz
3%	12250 MHz
1.5%	6340 MHz
12.5%	None Indicated

Table 2. Percentage of fax charts returned within the analysis region broken down by frequencies.

Many variables affect the quality of the fax chart reception: the vessel's antenna height and distance from the transmitter, the quality of the communications equipment aboard the vessel, the time of day, and even global atmospheric conditions. Despite this complexity and the small data set, the simple study described here provides some useful insight into the reception quality of IIP's fax chart. The 12750 MHz signal provides excellent service throughout most of the Western North Atlantic. The 13882.5 MHz frequency appears to provide a good signal for the Eastern and central North Atlantic. Over 90% of the returned charts in the study area were readable. IIP plans to conduct these analyses every three years. Therefore, based on this year's response from the maritime community, IIP expects to be able to continuously increase the sample size from which these analyses can be conducted in the future. IIP monitors every fax chart transmission from our Operations Center, yet there is no substitute for getting direct feedback from the mariner who relies on these charts.

SHIP COLLISIONS WITH ICEBERGS: AN HISTORICAL RECORD OF COLLISIONS IN THE SEAS AROUND NORTH AMERICA AND GREENLAND

Brian T. Hill

Institute for Marine Dynamics, National Research Council Canada, St. John's, Newfoundland

ABSTRACT

A database of over 560 incidents of ship collisions with icebergs has been compiled. Most of these collisions occurred in the North Atlantic but there are also several from around Greenland, the Canadian Arctic and sub-Arctic, and from the fiords of Alaska. The database nominally covers a 200 year period from about 1800 to present, and was compiled from contemporary shipping newspapers and gazettes. It contains such information as the name of the vessel, geographic location, and other factors when known such as vessel speed, iceberg size, damage and loss of life. The long term trend of collisions with icebergs on and around the Grand Banks correlates well, for the most part, with the re-constructed sea ice records off the east coast. The decades around 1890 were unusually severe in ice conditions and this is reflected in the number of casualties. Correlation between the two data sets becomes increasingly less apparent throughout the 20th century and this is likely due to better iceberg monitoring and detection methods. Incidents still occur at an average of 1 to 2 per year and still pose a threat to operators and navigators on the Grand Banks where oil resources are being increasingly developed. This paper discusses the trends in collisions.

INTRODUCTION

Icebergs in waterways have long been objects of awe and of fear. Perhaps the first description to come down to us is from St. Brendan's reputed voyage from Ireland to North America in about 570 AD in which the iceberg is described as a column of pure crystal. It is highly likely there were many later encounters and probably losses sustained by the Vikings and by early Basque fishers and whalers but it is not until 1686 that we have the first recorded casualty when the *Happy Return* struck ice in Hudson Strait. The mariners were probably indifferent to the ice type of their encounter but the fate of the ship *Anne* (Treby, 1724) in April 1704 leaves no doubt as to the nature of the ice as the vessel bounced twice off a huge island of ice. Eleven men were to die, and survivors suffered from frostbite and subsequent amputations, in their struggle to reach St. John's in an open boat.

There are about 400 recorded collisions of ships of various types hitting icebergs in the North Atlantic during the 19th century and up until the most famous incident ever, the sinking of the *RMS Titanic* with the deaths of over 1500 people in 1912. The loss of life, huge in itself in this one event, is less than half the total recorded in the last 200 years. Prior to the *Titanic* disaster there had been concern for high speed marine traffic in natural hazards of fog and ice as well as derelicts and there had been calls for sea patrols to provide forewarning. The International Ice Patrol (IIP) was inaugurated shortly afterwards, and to this day regularly delineates the area within which floating ice poses danger to shipping in the Grand Banks area. No incident has occurred outside their posted ice limits in this area since, but despite their warnings and improved ship-borne aids to ice detection, there have been over 130 collisions in that time inside their limits. Of these, there have been 10 serious incidents in the approaches to Newfoundland since 1980 alone. In the last 20 years there have also been about 20 other incidents around the coastlines of North America including the Arctic and Alaska.

Better detection methods and ship technologies have changed the nature of the incidents. Larger icebergs are more easily detectable with current radar systems making a recurrence of a *Titanic* like tragedy extremely unlikely. It is the smaller icebergs, the growlers and the bergy bits which are hidden from radar in heavy seas or fields of sea ice, which pose the main threat, as is well illustrated in all the recent incidents. The potential for loss of life, while still a considerable concern particularly in smaller vessels, is now reduced due to improved rules and regulations for safety of life at sea and more expedient rescue services. However, vessels today are typically much larger, carrying huge amounts of expensive cargo. Repairs to the bulk carrier *m/v Trave Ore* after striking a bergy bit in 1989 amounted to \$4M, not to mention losses due to damage and non-delivery of cargo and losses incurred with a vessel out of service. Ecological concerns are important factors. Fortunately, when a growler rent a 7 by 3 metre hole in the bow of the *m/v Omikronventure* in 1993, none of the 600,000 barrels of oil was lost, and although not in itself an impact with ice, the *m/v Exxon Valdez*, the largest ecological disaster of our time, went aground spilling 11 million gallons of crude oil when trying to manoeuvre around icebergs.

Incidental preparation of this report began during the preparation of another report, The Historical Record of Sea Ice and Iceberg Distribution around Newfoundland and Labrador,

1810 - 1958 (Hill, 1998). The collection of data for this report spanned many years and it became apparent while doing so, that it contained many reports of ships being damaged or sunk by pack ice and icebergs. As oil and gas discoveries on the Grand Banks were nearing the production phase at this time, there was increasing interest in the incidence of ice and how it may pose a threat to production platforms and supply vessels. The Institute for Marine Dynamics is currently involved in a 3 year Joint Industry Project on the interaction of bergy bits with ships and structures. Also, there was renewed interest in the *Titanic* theme thanks to Hollywood, and so it was decided to incorporate the collision database into a report to meet the many requests for information being received.

Figure 1: Geographic distribution of 360 known locations of iceberg incidents

Several of the incidents in the database presented here were found during the initial search for sea ice reports, as mentioned above. However, that search concentrated mainly on the winter months January to April and occasionally into May. While iceberg incidents from outside that time frame were noted, it left approximately half of each year unsearched. This is now essentially complete with contemporary daily to weekly material checked continuously from 1820 to 1947, 1985 to 1988, 1991 to 2000, reflecting archive sources available to the author, in addition to secondary sources covering the whole time frame. While further incidents will certainly come to light, it is believed that additional data will not greatly affect trends now discussed.

INFORMATION ABOUT THE SOURCES AND THE DATA

The primary sources of information on the ship collisions were the New York Maritime Register (1869) and Lloyd's List (1741) supplemented by other journals and newspapers as outlined in the Bibliography listed with the database. Compiled shipping and shipwreck databases, some available on the Internet, have also given information. Often, the information for each of the incidents was built from a number of sources, few giving the full

information. Some incidents have their stories set out in books as in the case of the *Anne*. The story of many others would be worthy as books.

The focus of the incidents was on ship collision with icebergs. However, the term iceberg was often used loosely, and while it should be ice of glacial origin as opposed to that formed by the freezing of sea water, mariners often made no such fine distinctions. Generally, if the term iceberg was used then it was included in the list of incidents. The exceptions were if the location made the presence of glacial ice doubtful as in the Bering Straits, where multiyear sea-ice would be more likely. These cases have been omitted until confirmatory reports are found. There were also several incidents in the Cabot Strait, around the east coast of Cape

Figure 2: Chart of the approximately 300 known locations of iceberg collisions off Newfoundland with the Titanic location marked as a square.

Breton and the mouth of the St. Lawrence, where it was likely that some of these events were caused by thick ice floes rather than icebergs. In other cases the description just mentioned ice or pieces of ice and best judgment was used in deciding whether these could have been icebergs, depending on locality, nature of damage, and time of year.

DISCUSSION

The search for iceberg incidents was confined to North American shipping routes and waterways so any relating to icebergs off Antarctica were ignored, and there is only one incident far to the east of Greenland. The southern coasts of Alaska have many small valley glaciers which calve small icebergs into the Pacific waters and have caused some grief to shipping over the years, but it is the Labrador current flowing along the east coast of

Newfoundland and over the Grand Banks which bring south the huge Greenland icebergs calved from the ice cap. The annual count of icebergs drifting south of 48° N as established by the IIP varies enormously from nil to the thousands with the peak season being normally April to June with an average of about 200 icebergs being present at any one time. Figure 1 shows the distribution of the 360 known locations of the 560 incidents around North America and Figure 2 shows where most of the incidents occurred off Newfoundland. Approximately one third of the incidents have no exact location so could not be plotted. The density of plotted collisions in the Strait of Belle Isle area is partly a reflection of the trans-Atlantic traffic in and out of Quebec and partly because of descriptions like “in the Strait of Belle Isle” and “off Belle Isle” permit a degree of accuracy in plotting. This is in contrast to statements like “off Newfoundland” which can be used to describe incidents several hundred miles offshore.

INCIDENCE OF SHIP - ICEBERG COLLISIONS

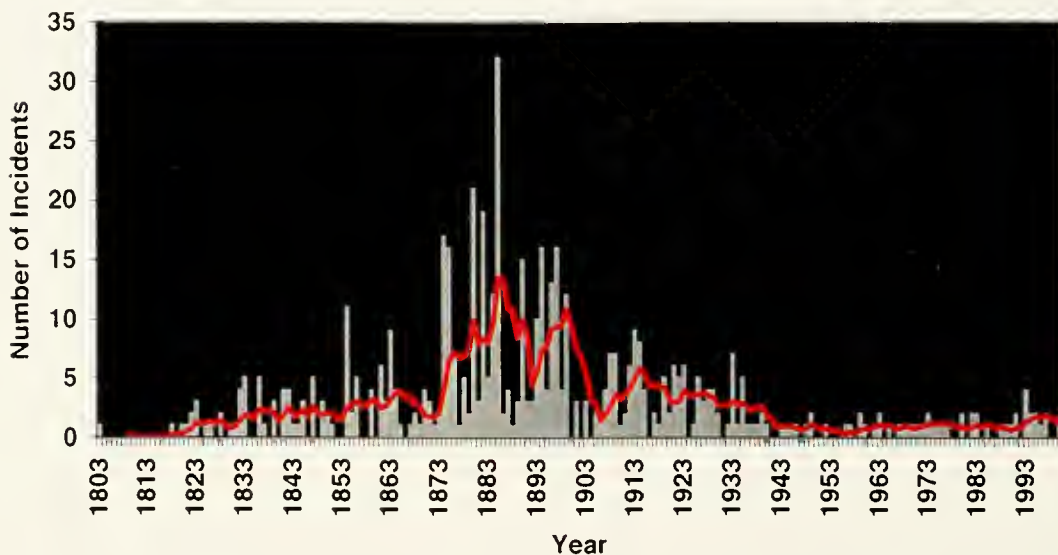

Figure 3: Annual number of iceberg incidents from 1803 to 2000 with 7 year moving average

Figure 3 illustrates the fluctuation of iceberg incidents in the North Atlantic over the years 1803 to present. While this may illustrate some bias in the reporting and publishing of incidents it is evident that there is a significant period of collisions centered about 1885 with smaller peaks of severity from the mid 1850's to mid 1860's, and again about 1913. Since about 1920 there has been an average of 1 to 2 incidents per year. In Figure 4, these data are compared with the historical sea ice extent off Newfoundland (Hill, 1998) and updated with recent data. Seven year moving averages were used to reduce noise levels. There is no accurate historic annual iceberg count prior to 1900 but there is a known general correlation between sea ice extent and iceberg severity (Marko et al, 1994) and in Figure 4 the periods of peak collision activity, are for most part, well matched with periods of unusually high ice extents. The historical sea ice extent from 1810 to 1958 was compiled from contemporary ice reports primarily from shipping newspapers and gazettes and revealed anomalously severe ice years between 1880 and 1900. The number of iceberg incidents during that time does appear to confirm the severity of those years. There has been a general decrease in ice

COMPARISON OF ICEBERG INCIDENTS AND SEA ICE EXTENT

Figure 4: Comparison of iceberg incidents with the deduced sea ice extent (Hill, 1998) using 7 year moving averages

severity since about 1930, but there are trends to more severe conditions around 1950 and again in the '70's and '90's. The cyclical variation of ice extent is discussed in Hill & Jones, 1990. It is interesting to note that in these cases there was no real corresponding increase in collisions. Figure 5 shows the period 1900 to present in more detail and uses the annual iceberg count as provided by the IIP. The steady decline in incidents from the early 1910's through the 1920's is evident. Thereafter, the annual number of incidents remain at a low level often reflecting the occurrence of icebergs but not the magnitude. It is tempting to see

COMPARISON OF ICEBERG INCIDENTS WITH NUMBER OF ICEBERGS

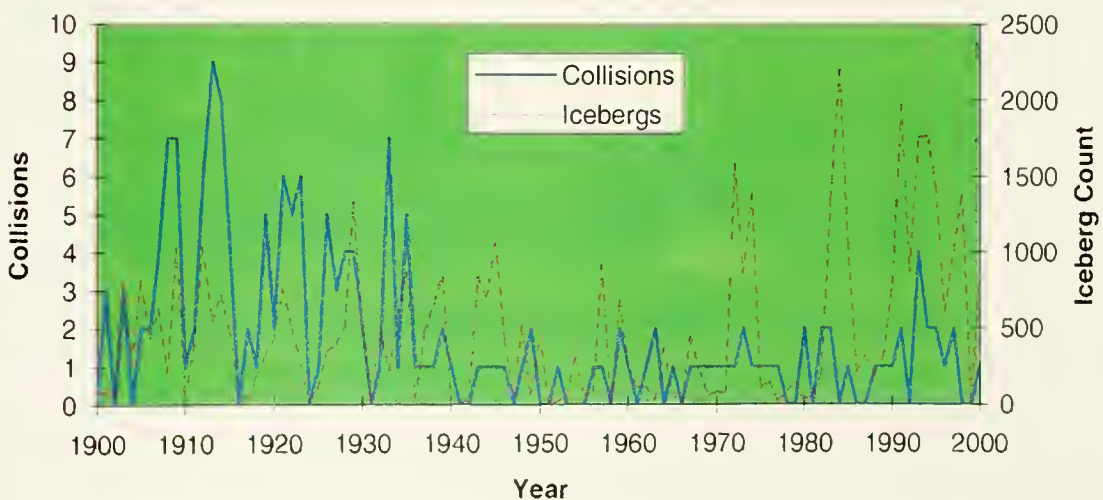

Figure 5: Comparison of iceberg incidents with the IIP annual iceberg count south of 48°N

LOSS OF LIFE DUE TO ICEBERG COLLISION

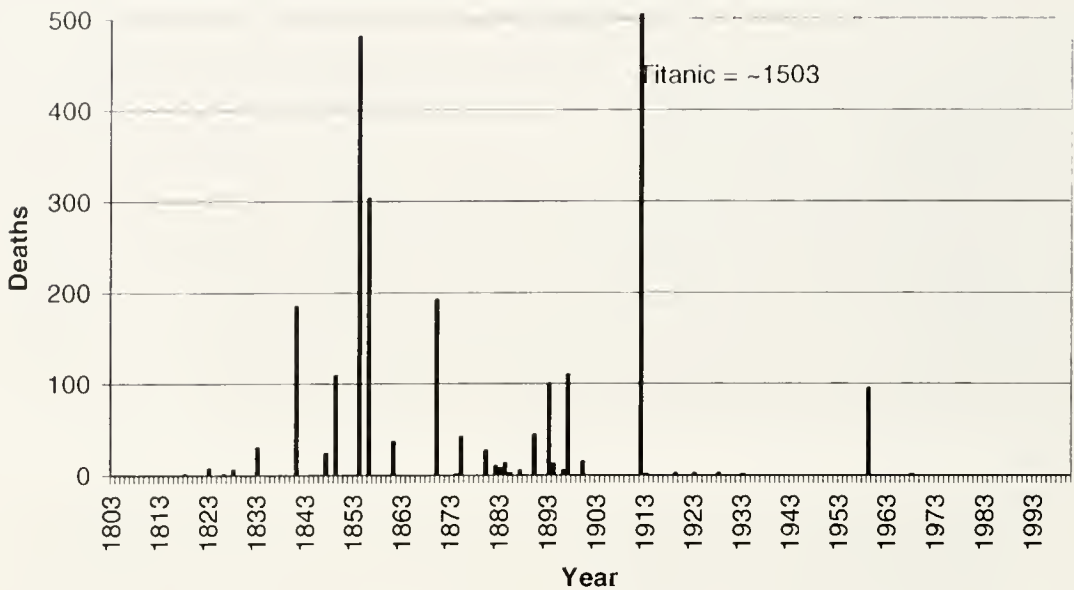

Figure 6: Distribution of loss of life in iceberg collisions from 1803 to 2000 during which 3377 souls perished

in this reduced level of incidents the awareness of danger brought about by the shock effects of the *Titanic* disaster, and the effectiveness of ice warnings given out by the IIP.

3377 people have lost their lives in these incidents with almost half being in the *Titanic* alone and this is graphically represented in Figure 6. The next highest loss of 480 occurred when the *City of Glasgow* went missing in ice in 1854. The largest loss of life since the sinking of the *Titanic* was in the sinking of the *Hans Hedtoft* in 1959 after colliding with an iceberg off Cape Farewell, Greenland on the return portion of her maiden voyage en route for Copenhagen from Nuuk (Godthaab) when 95 people drowned. Figure 7 compares the 545 incidents, sorted by month, which occurred in the North Atlantic with the average monthly occurrence of icebergs from 1900 to present. As one might expect, the distribution is very similar, the most accidents occurring in the months in which the most icebergs occur though it is not known how this is influenced by seasonal variations in the volume of marine traffic. This demonstrates that icebergs pose a threat throughout all months of the year. The *SS Arizona* was a well known ship in her time and provides one of the most spectacular cases when in November 1879 she sailed full speed into a huge iceberg in foggy conditions and drove her bow in 20 feet. She remained afloat with her 509 passengers and going part of the way stern first, limped into St. John's where an early photograph was taken of her. As a Blue Ribband winner her popularity increased as she became renowned as one of the safest ships because what other ship could have withstood such an impact and stayed afloat!

All the incidents which occurred around North America are summarized in Table 1 and sorted by sailing vessels on one hand and steam and motor powered vessels on the other. Sailing vessels are typically comprised of full square rigged ships, barks and brigs. Schooners were classified as sailing vessels unless there was evidence that they were otherwise powered. The

MONTHLY DISTRIBUTION OF COLLISIONS AND AVERAGE ICEBERG NUMBERS

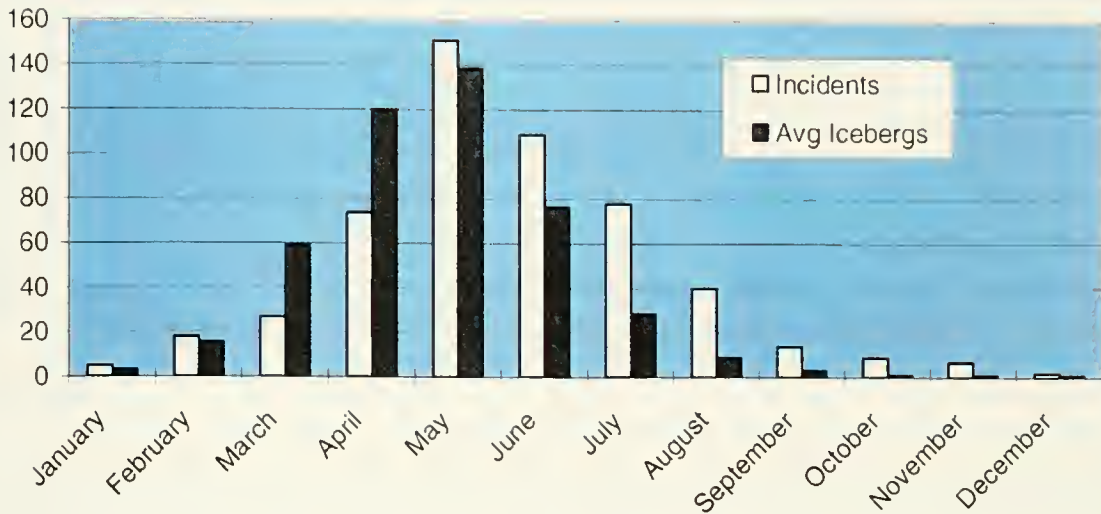

Figure 7: Comparison of 545 incidents in the North Atlantic sorted by month and the average monthly iceberg count south of 48°N

incidents are summarized over 10 year periods except for the last, 1990 – 2000. The transition to fuel powered ships is apparent, as is the increasing robustness of the vessels as iron and steel replaced wood and the ships were built to safer designs. The chances of a sailing vessel surviving an impact with an iceberg was only 50% compared with 20% for a more modern vessel. The percentage of vessels lost is high both for sailing and fuel powered ships in the decades 1940 – 1970. This could be partly due to the nature of the material researched covering that period where the tendency might be to highlight only the more serious incidents. The decades on either side of 1890 have the highest number of incidents over the entire record as reflected in the ice severity, and marks the transition of sailing ships to steam power: 65 to 39 in the period 1880-1889, then 41 to 60 in the decade after. Steam powered vessels totally lost to icebergs decreased over the same period from 23% to 15% while sailing vessels remained essentially the same. Percentage of steam vessels lost continued to fall in the following decades and those around the time of the *Titanic* have the lowest loss rate of the history. This illustrates that the ships of this time had an ability to survive impact. Of the other two steam ships which sank in the decade of the *Titanic*, one was SS *Yucatan* which hit a submerged berg in Icy Strait, Alaska and sank in 8 minutes without loss of life, and the other was the SS *Normandy* which either hit a rock or iceberg off Tors Cove, Newfoundland, again without loss of life. In this context the loss of the *Titanic* with over 1500 people is remarkable. The percentage of vessels lost after impact is higher in recent decades than those around the *Titanic* but this is probably due to the type and size of vessels involved. All of these recent incidents have been in more northerly waters such as freighters in Arctic waters or some kind of fishing vessel operating off northern Newfoundland or Labrador. The *Finnpolaris*, which went down at 72°N in 1991, had an ice class rating Type A, but it is doubtful if fishing vessels such as the *BCM Atlantic*, which was lost in 2000, had any ice rating and the smaller size of such vessels without subdivision put them at higher risk. During the high iceberg count years 1993 to 1995, six large carriers

were substantially damaged by contact with growlers or bergy bits on the Grand Banks or its approaches.

CONCLUSIONS

A database of over 560 ship collisions with icebergs in North American waters has been compiled. It spans a time frame of over 200 years and the collision trends help confirm fluctuating ice severity on the Grand Banks area of the North Atlantic over the same period as established by the author in an earlier work (Hill, 1998). Of particular note is the period of severe ice conditions between 1880 and 1900 when over 200 vessels were damaged. This also marks the transition of sailing to steam vessels. Correlation between collisions and ice extent becomes increasingly less apparent as the 20th century progresses and is likely due to better iceberg monitoring programs and better detection techniques. However, incidents are still occurring at an average rate of 1 to 2 per year. Fishing vessels operating in ice covered waters off the northern part of Newfoundland and off the east coast of Labrador comprise the main component of vessels lost in recent years while icebergs on or near the Grand Banks account for the majority of incidents with larger ocean going vessels. The database, which includes a summary of the incident, date, geographic location, damage and any known human injuries is included in the following pages.

ACKNOWLEDGEMENT

The author wishes to thank the staff of the Maritime History Archives at Memorial University of Newfoundland for their generous assistance.

DATABASE OF SHIP COLLISIONS WITH ICEBERGS

Brian T. Hill

This database concentrates on iceberg collisions in the North Atlantic off Newfoundland and Labrador but does include a few incidents further north, around Greenland, and also in the fiords of Alaska. The format of the database follows the same style as that which appeared in the 1973 International Ice Patrol Bulletin. Now approximating 500 incidents, the database is comprised of the original 60 mentioned in the Bulletin plus what was found while researching material for the "Historical Record of Sea Ice and Iceberg Distribution around Newfoundland and Labrador, 1810 – 1958", report LM-1998-02. The scope of that report was mainly limited to the winter months January through April and provided a little over 200 incidents. The search now continues through the remainder of the calendar years using contemporary shipping journals and newspapers. Others have been found in a variety of databases, articles, and insurance records, the principal sources being acknowledged below.

The database focuses on incidents of ships striking icebergs which being ice of glacial origin also includes the smaller categories of growlers and bergy bits. Definitions can be found in MANICE. Sometimes it is unclear whether a "piece of ice" is a small iceberg or ice floe. Best judgement was used in deciding which was more likely though in practical terms the difference is only one of terminology since damage still occurred. There are many grim tales of death, destruction and survival in the ice without the presence of icebergs.

This database will continue to grow as more incidents are found. Any comments and additions are very welcome.

Additions and modifications since the previous version dated 1 March, 2000 are shown with the vessel name in bold and/or red.

18 Mar 2000	53°09'4"N 52°11'W, ~240 km E of Goose Bay, Labrador	Shrimp Trawler BCM Atlantic , 870 t, operating in ice was holed 1am in heavy snow probably by a bergy bit	Crew took to boats rescued by FAME 3 hrs later	Sank
April 1997	53°11'N 54°26'W, 80 mi NNE of Bell Island; at Argenta 6 April	Stern Trawler ACADIENNE GALE , 748 gt struck by a large piece of ice	None	1 meter square hole in steering gear compartment on starboard quarter
20 Jun 1997	49°47.5'N 55°36'6"W Notre Dame Bay, NF for Bonavista	M search & rescue v HARP struck a bergy bit at 0315	None known	Small dent in port bow shell plating
21 Jul 1996	Hudson Strait? From Gydnia to Churchill, Manitoba	M/Bulk Carrier REDUTA ORDONA , 20,257 gt hit a berg	None known	Extensive damage to bow Nos 1 & 2 holds Out of service till Sep 16
26 Aug 1996	Glacier Bay Alaska ~58°22'N 136°W	Catamaran SPIRIT OF ADVENTURE took a large piece of ice (bergy bit?) between her hulls	None	Both hulls punctured, plugged with wood and returned safely
8 Jun 1995	Off Botwood, 49°09'N 55°20'W	M/V UB PRINCE struck a growler	None known	Split in bulbous bow, damage to forepeak tank, 1 mo. delay
19 Jul 1995	63°05'N 67°42'W, Daniel's Harbour Frobisher Bay, Arctic	Russian M/pass. ferry ALLA TARASOVA sustained ice damage	None known	Vessel holed but no help requested
2 Jan 1994	Prince William Sound, 25 mi S of Valdez, for Valdez, Alaska	Tanker OVERSEAS OHIO hit a ~4,000 ton berg at 10 kts	None	Bulbous bow squashed, ruptured ballast tank; ~\$1M
7 April 1994	From Antwerp to Montreal	M/V Bulk Carrier FEDERAL THAMES in severe ice	None known	3m x .5m hole in bulbous bow
4 May 1994	44°44'N 49°12'W from Quebec to Norway	M/V Bulk carrier EIRINI L hit ice	None known	30 cm hole in bow port plate of bulbous bow
4 Feb 1993	45°N 49°13'W, from Montreal to UK and Europe	M/V OOCL CHALLENGE struck growler at 18½ kts	None known	Considerable damage, 30' gash in bow and additional cracking in ballast tanks
17 Apr 1993	46°12'N 46°04'W from Montreal to Antwerp	M/V CAST POLARBEAR hit "drifting pack ice"; almost certainly a small iceberg	None	Severe damage to bow and forward compartments, already repaired from ice damage received earlier in the Gulf of St Lawrence
28 Apr 1993	Approx. 47°45'N 48°30'W, from Norway to New York	M/V OMIKRONVENTURE L with 600,000 barrels of oil struck growler	None	7 by 3 meter hole in forepeak plus cracking; no oil pollution resulted
11 Sep 1993	Kangerlussuaq Fiord, Greenland	CSS HUDSON hit a berg	None known	Holed
22 Apr 1991	16 km off Cape Race	MARINE TRANSPORT struck ice floes	Crew rescued and arrested for drug smuggling	Sank, lying in 50m of water with several hundred kilos of cocaine onboard for Quebec
11 Aug 1991	72°N 59°58'W off Greenland, chartered to Canarctic to carry zinc	Cargo ship FINNPOLARIS with zinc ore struck a bergy bit on	Crew rescued	Listed and sank 15 hours later on the 12 th

DATE	POSITION	DESCRIPTION OF INCIDENT	LIVES LOST/INJURED	DAMAGE
	ore form Nanisivik mines	the starboard bow		
16 Aug 1991	Prince William Sound, Alaska	Fv BALTIC SEA hit a berg (mobile glacier ice)	None known	Drydocking required
3 Oct 1990	Melville Bay Greenland, 73°48'N 78°04'W or near Arctic Bay Canada	TERRA NOVA struck iceberg while following USCG Polar Star	?	Constructive total loss
6 Jul 1989	158 nMi E of Belle Is 52°27'N 51°13'W, from Quebec to Hamburg, Germany	Bulk carrier TRAVE ORE struck a berg bit at full speed (12kts) in dense fog	None	Damage to forepeak tank, No 1 port wing tank, No 1 cargo hold, \$4M
8 Apr 1988	North of Jan Mayen Island	M/fv VESLEMARI hit a berg	None known	Sprang a leak and sank
9 Aug 1988	Off Greenland coast, 67°47'N 29°48'W	M passenger/cargo AQQALUK ITTUK hit a large piece of ice	None known	4 x 40cm hole, leaking towed to Angmassik for repairs
31 Aug 1988	40 mi SE of Juneau, Alaska near twin Sawyer Glaciers	Catamaran sightseeing GLACIER EXPRESS hit a berg between hulls during tide rip	None	Serious leak, took refuge in cove, additional pumps supplied
16 Jun 1985	53°10'N 52°05'W	Can. F/V PANDALUS hit ice	None known	Sank
27 Apr 1983	15-18 nM NE of Little Fogo Is., Newfoundland	Longliner GLADYS IRENE struck by floating ice	?	Sank
22 Jun 1983	Hopedale Channel Labrador	Dragger KRISTINA LOGOS struck large piece of ice while fishing	?	?
11 Mar 1982	Labrador Basin	Dragger H M KAISER struck piece of ice while fishing	?	Took on water
16 Jun 1982	47°29'N 49°19.5'W	M/V CANADIAN BULKER hit a 650,000 tonne iceberg	Unknown	Continued to St.John's for repairs
6 May 1980	Atlantic Ocean	Dragger BURHOUND struck iceberg in dense fog	?	Damage to port side aft
7 May 1980	Strait of Belle Isle	Tanker LAKE ANJA in pack with growlers	?	Damaged bow and port wing tank
2 Jun 1977	16 mi E of Square Is., Labrador 52°45'05"N 55°20'W	CN ferry M/V WILLIAM CARSON holed in heavy ice	None	Abandoned and sank
19 May 1976	Strait of Belle Isle	Bulk carrier LOUIS MAERSK struck floating ice	?	?
20 Aug 1975	60°27'N 64°59'W	Tug M/V AIGLE d'OCEAN hit a berg	None known	Sank
June 1974	Gulf of St. Lawrence towards Strait of Belle Isle	Freighter IVORY STAR struck a growler or bergy bit	None	Extensive bow damage
3 Feb 1973	45°48'N 46°23'W	M/V HAVJARL hit berg	None	Extensive bow damage
7 May 1973	Near Newfoundland coast	M/V NAVI CHAMPION hit a berg	None	Ruptured 4 meters in forepeak
12 Aug 1972	40 mi E. of Cape Bauld	M/V RATTRY HEAD hit a berg	None	Minor Damage
23 Apr 1971	53°04'N 52°14'W	F/V SANTA ISABEL hit a berg	None	Sank

DATE	POSITION	DESCRIPTION OF INCIDENT	LIVES LOST/INJURED	DAMAGE
Jul 1970	Baffin Bay	USCGC WESTWIND hit a berg	None	Minor damage
22 Apr 1969	Near Greenland	German vessel	?	Hole in bow
Jun 1968	Chance Harbour, Nfld	Ice fell from iceberg onto small boat	1 life lost	Boat crushed
23 Apr 1967	Off Newfoundland, probably on Southampton - Montreal run	M/V BATORY hit a berg	None	7' hole 15' below water line
1965	Strait of Belle Isle	SS KYLE struck berg	Unknown	Serious
25 Nov 1965	Off Kap Farvel, for Bremerhaven	BURGERMEISTER SMIDT hit berg	?	Sank
29 Apr 1963	Off S.E. Greenland	M/V VALO I hit a berg	?	Sank
3 Aug 1963	Hudson Strait for UK	Yugoslav freighter KASTELA hit a berg	No record of survivors	Sank
1962	Sealing grounds (same incident as 1962?)	SS sealer KYLE hit a grounded berg	None known	Grounded and derelict at Harbour Grace
May 1960	Off Newfoundland	M/V QUEENSGARTH hit a berg	None	Hold flooded
30 Jan 1959	59°30'N 43°00'W from Godthabb to Copenhagen	M/V HANS HEDTOFT hit a berg on return portion of maiden voyage	95 lives lost	Sank
24 May 1959	47°00'N 52°30'W	M/V LYDIA MARIA hit a berg 20' by 100' at 9 knots	None	Extensive dry-docking required
4 Feb 1957	48 mi E of Cape Breton from Sydney to St Pierre	M/V PETIT BRAS D'OR hit a berg	Unknown	Sank
10 Jun 1956	Off Twillingate, Nfld 49°57'N 54°43'W	Schooner THOMAS S GORTON hit berg from Carbonear to Labrador	0. Crew rowed to Twillingate	Sank
Sep 1952	Davis Strait	F/V RIO CAIMA hit a berg	Unknown	Sank
23 Jun 1949	Leaving St. Anthony, NF	Schooner JENNIE FLORENCE experienced engine trouble on leaving port and drifted into and iceberg	None	Slight damage
27 Jun 1949	Near Cape St. John, from Lewisporte to Baie Verte	Schooner GERALD & AIDEN struck a piece of ice	None	Slight damage
6 Jun 1948	48°12'N 52°55'W, 30 mi NE of St. John's	M/V NEVADA hit a berg in dense fog at 1 23 pm, proceeding to St. John's	None	Extensive damage above waterline, collision bulkhead tight: \$35,000 damage
24 Jun 1946	Grand Banks	F/V COMMANDANTE TEN REIRO hit a berg	None	Sank
29 May 1945	43°08'N 49°18'W	Convoy O.N.303 encountered a berg 4,500 x 3,300 x 50' in fog. 2 ships hit berg, 19 ships collided with each other	None	Slight damage

DATE	POSITION	DESCRIPTION OF INCIDENT	LIVES LOST/INJURED	DAMAGE
14 Jun 1944	Davis Strait	F/V MARIA PRECIOSA hit a berg	Unknown	Sank
13 Mar 1943	~100 mi S of Cape Farewell 58°05'N 44°15'W	Tanker SS SVEND FOYN hit a berg from New York to Liverpool	Unknown	Sank 2 days later
19 Jun 1940	17 mi S of Groais Is, NF	Schooner SHIRLEY REID struck a piece of ice	None	Sank in 5-6 minutes
9 Jun 1939	48°16'N 49° 27'W, 150 mi E of St John's	Wood schooner (or Fr. Bark) BEN-HUR hit a berg	Crew transferred to DUCHESS OF BEDFORD	Set on fire and abandoned
7 Aug 1939	51°58'N 54°18'W from Montreal to London	SS BEAVERHILL hit a berg at 5.30 am	None	Minor damage to No4 tank plates
17 Jul 1937	Strait of Belle Isle, from Newcastle and Leith for Montreal	SS CAIRNGLEN hit a berg	None	Minor damage, arrived Montreal 20".
12 Feb 1936	150 mi E of C. Sable	Fishing Schooner GERTRUDE M. FAUCI struck berg	Unknown Crew picked up	Leaking badly
11 Apr 1935	Labrador Sea	Wood schooner SAINT COULOMB hit a berg	Unknown	Sank
11 Apr 1935	Off Newfoundland	SS TOWER BRIDGE struck berg	Unknown	Leaking, 14 plates later replaced
5 Jun 1935	For Montreal arr. June 10	SS MANSEPOOL struck a berg	None known	Forecastle plates bent back and opened; above waterline
24 Jun 1935	Near St. John's arr. June 25	SS IMOGENE struck heavy submerged pieces of ice	None known	Leaking considerably in No.2 hold bilge
18 Jul 1935	Off Bell Isle from Montreal	SS PHILIP T. DODGE grazed an iceberg	None known	3 port bow plates damaged and frames, lowest 12" above water
1 Oct 1935	Wakeham Bay, Hudson Strait 62°15'N 71°39'W	SS BRIGHT FAN hit a berg, from Churchill to London	Unknown	Sank
4 Jul 1934	Arrived Corner Brook July 15	Fin SS STARCK hit a berg	None known	Slight damage to forecastle plates above waterline
Apr 1933	N. Atlantic from Grangemouth to Montreal arr. 27 Apr	SS ASHWORTH suffered ice damage	None known	Forepeak flooded, 9 plates buckled, 1 badly fractured, stem twisted, 6 side frames buckled, 2 broken
May 1933	Attempting to reach Botwood returned St. John's May 30	Stmr GERALDINE MARY struck a block of ice almost entirely submerged	None known	No 5 hold leaking, damage to plates and frames; estimated 10 days to repair
17 May 1933	Off Cape Francis from Wabana to Rotterdam with iron ore	SS SEIRSTAD struck a berg (see 21 July 1921)	Crew in boats all night; safe	Sank
28 May 1933	About 125 mi SE of Cape Spear on the Grand Banks, 45°N 50°W?	Schnr DOROTHY MELITA hit a berg; pumps manned for 2 days	1 man out of 23 lost	Abandoned 30th; crew rowed to Cape Spear in a day and a night
Jul 1933	Strait of Belle Isle, from London to Montreal arr. Aug 1	SS DUCHESS OF BEDFORD hit a berg	None known	3 plates damaged

DATE	POSITION	DESCRIPTION OF INCIDENT	LIVES LOST/INJURED	DAMAGE
Aug 1933	Limped into Port Union Aug 29	Schnr JENNIE AND ADA SMITH hit a berg	None known	Bowsprit and main boom cracked and hull damaged
11 Oct 1933	Labrador Sea	Wood schooner MAIA hit a berg	Unknown	Set on fire and sunk
19 Feb 1930	50 mi W of Cape Race	SS EMILIE MAERSK hit ice or wreckage	Unknown	Hole in port bow
18 Jul 1930	Atrait of Belle Isle, 51°33'N 55°39'W	SS DALRYAN ran aground on a berg from Swansea to Montreal	None known	Bow stuck on ledge of berg, Nos 1&2 hold leaking, floated off later
3 May 1929	For Botwood, arrived May 6	SS GERALDINE MARY fouled a growler	None known	Port side No 1 hold frames bent and rivets leaking
Jun 1929	North Atlantic, from Montreal arrived Hamburg 18 June	SS EMDEN hit a berg	None known	Damage to stem
14 Jun 1929	47°53'N 49°11'W from Montreal to London	SS CAIRNGOWAN struck a berg (see also 4 May 1914)	None known	Severe and extensive damage to forecastle and No 1 hold
20 Jul 1929	About 42°42'N 49°43'W from New Orleans to London	SS VIMEIRA hit a berg 11.50 pm in clear weather	None directly	Extensive damage to bow and propeller and had to be towed. When being drydocked in Rotterdam for repairs was destroyed by explosion and fire killing 12 crew and drowning 3.
18 Oct 1929	N. of Petersburg, Alaska	M/V NORCO hit a small berg	None known	Damage slight
23 Oct 1929	3 mi from Midway Light, Stephen's Passage, Alaska	M/V UNACANA hit ice from Ketchikan to Juneau	None known	2 plates set up and several rivets loosened
9 Apr 1928	From St. John, NB to Liverpool ~700 (?) mi off Canadian coast	SS MONTROSE struck a berg (see also 27 Jul 1909, and July 1899)	2 Men on deck killed by falling ice from iceberg	Extensive damage to stem and bows above waterline, anchors lost
May 1928	North Atlantic on Liverpool - Montreal runs	SS MONTCLARE encountered icebergs on both legs	None known	Propeller blades damaged
18 Jul 1928	Strait of Belle Isle from Montreal to Hamburg	SS WAZIRISTAN struck a berg	None known	Slight damage to port bow
27 Oct 1928	Bound for Lush's Bight, NF arr. Little Bay Islands 2 Nov	SS Lunenburg schooner ALSATIAN hit a berg	None known	Bowsprit gone
May 1927	Off Cape Farewell, Greenland, from Ivigtut May 20 for Copenhagen	Steamer HUGO disappeared, thought to have hit a berg	? all hands	Lost
Jun 1927	160 mi E of St. John's from Swansea to Montreal	SS HALSE hit a berg	None known	Water in forepeak, forehold and No. 1 tank. Arrived St. John's 30 June
3 Jul 1927	Approximately 51°N 54°07'W from Montreal to Glasgow	SS MONTCALM struck a submerged iceberg	None known	One propeller blade bent
3 Jul 1927	50°30'N 58°38'W from Montreal to Manchester	SS MANCHESTER CITIZEN grazed an iceberg	None known	One port bow plate and 3 propeller tips damaged
Mar 1926	North Atlantic from New Orleans to Charlestown	SS TASMANIC. First report said she hit a berg; next that she	None known	Apparently none [not included in stats]

DATE	POSITION	DESCRIPTION OF INCIDENT	LIVES LOST/INJURED	DAMAGE
		passed near but did not strike		
12 May 1926	Off the Grand Banks from New York and Boston to Londonderry	SS CALIFORNIA collided with a berg and split it in two	None known	Unknown
26 May 1926	150 mi SE of Cape Race from Montreal to UK	SS WESTLEA hit a berg while going slowly in dense fog	None known	Put in to St. John's May 28 with serious damage, forepeak and No 1 tank being full of water
2 Jun 1926	Off Cape Race from Port Said to Montreal	SS INNERTON hit a berg	None known	Arrived St. John's Jun 2 with bows badly damaged; 42 plates
27 Jul 1926	Off Cape Spear from Montreal & Charlottetown for St. John's	SS HITHERWOOD hit a berg in fog	None known	Leaking
29 Aug 1926	When leaving the Strait of Belle Isle from Montreal? to Liverpool	SS AURANIA struck a berg a glancing blow at dead slow in fog which then bumped and scraped along the port side	None known	Unknown except for bent propeller blade which made contact with the iceberg
8 Nov 1926	4 mi N of Petersburg in Frederick Sound, Alaska	Gas boat IOWA struck an iceberg	None known	Partially filled with water and towed into Petersburg
23 Jun 1925	42°20'N 48°13'W from Alexandria for New York	SS SAUGUS ran aground (aberg?) on the flat shoal of a drydock iceberg in dense fog	None	Was able to back off without damage and proceeded with voyage
27 Mar 1923	Off Sable Island	Fishing schooner WILLIAM A. MORSE hit a berg	Unknown	Hole in stbd side at the waterline, prop shaft bent
Apr 1923	North Atlantic from Seville (75 days)	Schnr CAPE RACE hit a berg	None known	Arrived St. John's Apr 29 damaged above waterline
24 Apr 1923	48°57'N 47°55'W	French fishing schnr. LE RAYMOUND hit a berg	At least 2 dead, some crew adrift for 19 days. 30 brought into St Pierre by schnr CARLICA	Sank
25 Apr 1923	46°15'N 44°05'W	SS ET BRETAGNE hit a berg	None	Sank
19 May 1923	Off Cape Ray, NF	SS OXONIAN hit a berg	None known	Arrived St. John's May 21 with hole in bow and holds flooded
June 1923	North Atlantic from Burntisland	SS ELEANOR MAERSK hit a berg	None known	Arrived Botwood June 19 with stem broken, anchor broken and several plates above waterline on both bows stove
21 May 1922	North Atlantic from Rotterdam to Montreal	SS WEST KEBAR hit a berg	None known	Stem and plates damaged, stbd. hawse pipe broken
3 Jul 1922	North Atlantic from Quebec to Liverpool	SS NORBURN struck a berg	None known	Several frames broken and plated damaged Put in to St John's July 5
24 Jul 1922	North Atlantic from Montreal to Liverpool	SS CANADIAN PIONEER hit a berg	None known	Stbd bow stove and forepeak flooded. Put in to Sydney CB
6 Aug 1922	Strait of Bell Isle 51°36'N 56°13'W	SS schnr MANCHESTER	Unknown	Bow damaged from forefoot to

DATE	POSITION	DESCRIPTION OF INCIDENT	LIVES LOST/INJURED	DAMAGE
	from Manchester to Montreal	CORPORATION hit a berg		forecastle, stem broken, plates broken and twisted, anchors broken and lost
25 Aug 1922	42°30'N 50°W from Galveston to Havre	SS HEGIRA was grazed by 2 large icebergs when she passed between them	None	Presumed not serious
1 Oct 1922	Point Adolphus, Icy Straits, Alaska	SS KETCHIKAN hit an iceberg and was beached	Crew saved	Serious; 50 plates to be removed; \$40,000
26 Feb 1921	Off Cape Race	SS PRINCESS MATIOKA struck berg or submerged wreck	Unknown	Slight damage to steering gear
June 1921	46°48'N 46°41'W from Copenhagen to New York	Danish Bk ASTRID struck a berg	None known	Bow slope, repaired with cement, made St. John's 10th
7 Jun 1921	Off Nfld coast from Montreal for Dublin and Avonmouth	SS SEAPPOOL struck an iceberg	None known	Forepeak full of water and other damage, arrived St. John's 10th
8 Jun 1921	48°30'N 50°03'W from Philadelphia via St. John's to Hamburg	SS CHARLOT struck a berg	None known	Leaking in No 2 hold and returning to St. John's
21 July 1921	48°57'N 49°W from Bell Island to Rotterdam	Nor. SS SEIRSTAD with iron ore struck a berg	None known	Not seriously damaged and continued on journey (not so lucky 17 May 1933)
Aug 1921	North Atlantic from New York to Christiania	Nor. SS BERGENSFJORD hit a berg	None known	Arrived 11th with one prop blade bent, drydocked for examination
3 May 1920	45°08'N 48°46'W from Newport, UK to New York	SS TURRET CROWN hit a berg	Unknown	8' long hole in bow
June 1920	From Avonmouth to Port au Port, NF	SS HARTSIDE struck a growler	None known	Put into St. John's June 23 leaking
15 Aug 1920	Cape of Straits, Frederick Sound, Alaska	Motor schnr. TILLAMOOK struck an iceberg	None known	No leaks, docked for examination
25 May 1919	47°13'N 51°22'W for Glasgow from Montreal	SS CASSANDRA hit a berg	None	Forward compartments flooded
16 Jun 1919	Off Cape St. Mary's 46°31'N 54°23'W from Liverpool to Montreal	SS Schnr CRAFTSMAN hit a berg	Unknown	Partial loss, put in to Quebec. Arrived Montreal 30th.
26 Jun 1919	Off Cape Race from Sydney, CB for Wabana NF	SS MASKINONGE hit a berg	Unknown	10 plates stove in and hawse pipes broken; headed to St. John's for repairs
9 Jul 1919	45 mi off St. John's, from Montreal to Liverpool	SS GRAMPIAN hit a berg in thick fog at reduced speed and reversing engines, 5 am	2 killed in their bunks in the bow and 2 injured	Forecastle deck demolished, stem flattened, bows cut into 30'; all above waterline
Aug 1919	North Atlantic, from Cadiz June 25	Schooner ASQUITH hit a berg	None known	Lost headgear; arrived St. John's Aug 8
24 April 1918	1 mi N of Petersburg from Ketchikan, Alaska to Anchorage	SS ADMIRAL FARRAGUT grounded on an iceberg	Unknown	Several oil and water tanks leaking though damage not dangerous
Jun 1918	Off Newfoundland coast	Schooner HARRY LEWIS hit a	Unknown	Towed into Cape Broyle June 10

DATE	POSITION	DESCRIPTION OF INCIDENT	LIVES LOST/INJURED	DAMAGE
		berg		with serious damage; headgear carried away and leaking
April 1917	42°50'N 51°W, arriving Baltimore April 25	Unnamed steamer ran into berg in fog at slow speed	None known	Backed off with slight injuries
4 May 1917	Off Cape Race from a European port	SS TRESILLIAN hit a berg, stranded before and after collision	Unknown	Serious damage, forward part of vessel crushed, drydocked
30 May 1915	Off Newfoundland coast	SS BEOTHIC struck a submerged berg	None known	Leaking badly, docking immediately at St John's
30 May 1915	North of St. John's from Cardiff to Bonavitsa Bay or Lewisporte	SS MANCUNIA struck an iceberg	None known	Serious damage and returned to St. John's for repairs departing again June 19
1 Jun 1915	Off Trinity Bay	Schooner FLOWER OF HOME struck an iceberg	Crew saved	Totally wrecked
11 Jul 1915	Straits of Belle Isle from Barry, Cardiff, UK to Montreal	SS Schooner AGENORIA hit a berg 100' high	Unknown	Severe damage to bow; after tanks flooded to raise bow
28 Apr 1914	Grand Banks	Fishing schooner ST. SOLENS hit a berg	Crew of 32 lifted by schooner MARIE and landed at St Pierre May 12	Abandoned May 5
30 April 1914	Arrived St. John's from Rotterdam	SS TELLUS collided with ice	None known	Forepeak and bow damaged and a new prop required
May 1914	East of Cape Race	SS ROYAL EDWARD hit a berg	None	Extensive damage to bow
4 May 1914	300 mi SE of Cape Race 41°21'N 50°50'W	SS Schooner CAIRNGOWAN hit a berg from Middlesburgh, UK to Montreal (see also 14 Jun 1929)	Unknown	Partial loss
16 May 1914	44°N 49°13'W	SS MANCHESTER SPINNER touched an iceberg	None known	Slight damage to bows
22 May 1914	110 mi NE of Cape Race 48°N 51°W	SS schnr ROYAL EDWARD hit a berg from Montreal to Avonmouth, UK	Unknown	Stem slightly damaged
29 May 1914	45°29'N 48°20'W	Wood schooner GOLFINO hit a berg	Unknown	Sank
Aug 1914	E of Belle Isle up St. Lawrence	SS PORT DALHOUSIE was injured by ice	None known	Injured, and later ran ashore in fog in St. Lawrence
29 Aug 1914	Atlantic, from Montreal to Avonmouth, UK	SS Schnr FLORISTON hit a berg	Unknown	Bows stove and forward parts filled with water. Compelled to run ashore 2½ mi W of Port Saunders, NF. Later refloated but went aground near Louisburg and was eventually wrecked
1913	Grand Banks	SS MOUNT TEMPLE hit a berg	Unknown	Unknown
1 May 1913	46°39'N 44°40'W	SS CHILTERN RANGE hit an iceberg 150' to 200' high	Unknown	Damaged bow plates

DATE	POSITION	DESCRIPTION OF INCIDENT	LIVES LOST/INJURED	DAMAGE
May 1913	North Atlantic from Fowey to Botwood	SS KASTALIA damaged by ice	None known	Arrived St John's 13th with bows damaged
3 May 1913	47°20'N 41°15'W from Pola, Spain to St.John's	SS SNOWDON RANGE, the way being off her, struck a berg 150' high and as long as could be seen in fog	None	No apparent damage
26 Jun 1913	Strait of Belle Isle from Shields to Montreal	SS CARLTON struck ice	None known	Bows dented, leak in ballast tank
10 Jul 1913	From Cardiff to Tilt Cove	SS MAGDA struck a small iceberg at slow speed in dense fog	None known	Damage not great
14 Jul 1913	Strait of Belle Isle	Schooner BRIGHT ROSE hit a berg	1 lost overboard	Unknown
Aug 1913	Off Belle Island from Southampton to Montreal	SS ANDANIA ran upon a submerged iceberg	None known	Smashed one of her propellers
1 Nov 1913	100 mi E of the Strait of Belle Isle from Montreal to Manchester	SS MANCHESTER COMMERCE struck a berg in early morning	Unknown	Severe damage, bows crushed to forward bulkhead. Arrived St. John's 4th, repairs estimated at 2 months
11 Apr 1912	Less than 10 mi from TITANIC's eventual fate	SS NIAGARA struck 2 bergs	Unknown	Cut below water line in 2 places.Pumps kept her free
14 Apr 1912	41°16'N 50°14'W. Located at 41°43'45"N 49°56'50"W	RMS TITANIC hit a berg from Southampton to New York	1234 fatalities reported at the time. Final tally 1503/2206? Survivors in boats picked up by CARPATHIAN	Sank early morning next day
21 May 1912	Off Cape St. Francis 47°45'N 52°45'W?	Schooner BONUS hit a berg from Bay Roberts to Sydney, NS	Unknown	Partial loss
July 1912	From Montreal July 20 (likely for Manchester in the Strait of Belle Isle)	SS MANCHESTER INVENTOR damaged by ice	None known	Put into St.John's 29th with forepeak full of water and water in No 1. hold
