This is part of one of the over 35 lesson plans in the National Weather Service education website JetStream - An Online School for Weather, a free resource at noaa.gov/jetstream.

**Lesson plan:
Moonlight Serenade**

Divide the students into pairs and distribute one observation form to each student.

Place a lamp on a table or desk and remove the shade.
Turn the lamp on.

Stick a 2" styrofoam ball on the pencil. Darken the room.

Have one student from each pair hold the pencil with the ball at arms length, blocking out the light from the lamp. Explain they represent the Earth, the ball is the Moon, and the lamp is the Sun.

On the observation form, under the "View from Earth" column, have that student draw/shade what their "moon" looks like, comparing the light and dark side of the ball. Have the student label this as "New Moon".

Have the other student mark the location of the Moon relative to the Earth and Sun on the dotted line (representing the Moon's orbit) under the "Position in Space" column.

Have the student holding the "Moon" rotate 45° counter-clockwise. Repeat steps 6 and 7. Label this as "Waxing Crescent". Rotate another 45°. Repeat steps 6 and 7. Label this as "First Quarter".

Repeat steps 6 and 7 for each additional 45°, labeling them as "Waxing Gibbous", "Full Moon", "Waning Gibbous", "Last Quarter", and "Waning Crescent" respectfully. Have the students switch positions and repeat the process again.
