

The Observing Air-Sea Interactions Strategy (OASIS)

– A UN Ocean Decade Program, co-led by NOAA,

Linking Air-Sea Interaction In Situ Observations, Satellites and Earth System Models

for A Predicted, Safe, Healthy, Clean, and Productive Ocean

airseaobs.org/get-involved

OASIS Co-Chairs: Meghan Cronin (NOAA OAR PMEL, USA), Christa Marandino (GEOMAR, Germany) & Sebastiaan Swart (University of Gothenburg, Sweden)
SCOR Working Group #162 & OASIS community

Talk Outline:

How does the ocean influence atmosphere?
How does the atmosphere force the ocean?

***We need more than
just SST & winds***

NOAA/OAR/PMEL's Ocean Climate Station's
Air-sea interaction observations

OceanObs19 & UN Ocean Decade – an opportunity for the community
to strategize and implement transformative changes to ocean observing

Observing Air-Sea Interaction Strategy (OASIS) Activities

Richard Carey

... the WATER Cycle, ENERGY Cycle, CARBON Cycle, and LIFE Cycle

1. The Ocean & Atmosphere communicate through Air-Sea Fluxes of Heat, Water, Momentum, Gas and Particles
2. These surface fluxes are interconnected, particularly during extreme events. **The Energy, Water, Carbon and Life cycles are all interconnected during extreme events**
3. Must consider the Air-Sea Transition Zone as an entity
4. Fronts and gustiness matter to the air-sea fluxes. Implications for modeling & observational strategies

The only part of the GOOS that measure air-sea fluxes are OceanSITES & DBCP mooring networks & Ship-based Meteorological SOT (Ship Obs. Team) network

IN SITU OBSERVING SYSTEM STATUS

The Global Ocean Observing System (GOOS) observes our ocean through the "eyes" of thousands of ocean observing platforms that are constantly monitoring the ocean to capture the signature of various ocean phenomena. These platforms collect physical, biogeochemical and biological Essential Ocean and Climate Variables. These observations flow into data systems and are crucial for tracking, predicting and adapting to climate change, accurate weather and extreme event prediction, monitoring biodiversity for achieving key global targets, and informing sound decisions by local communities and national governments around sustainable development.

To highlight the status and development of this Global Ocean Observing System, the **2023 Ocean Observing System Report Card** provides insight into the current status of the global observing networks and shows how these networks provide vital data for society. This edition showcases achievements and challenges in tracking marine heatwaves, advancing safety of life at sea, and ensuring seagrass ecosystems continue to support coastal life.

The diversity of coastal and biological observing activities is one of the current big challenges, both to integrate new data flows and to expand capacity globally to meet real and urgent needs. This is one of the key areas that needs additional coordination capacity, new and low-technologies, however it also offers opportunities to develop a truly integrated global observing system.

Highlights

GOOS is pleased to report that the global ocean observing networks monitored by OceanOPS, have now all mostly recovered from the impact of COVID-19 on their operations.

See in situ networks table for map legend. Latest locations of operational platforms and ships as of July 2023, reference lines sampled since January 2022. Symbols size is not to scale, in the map they are exaggerated to an order of hundreds kilometers for readability. Data source: OceanOPS.

Over the past year, the observing system remained stable in terms of platforms and instruments at sea, however, there have been significant advances in technology, autonomous instruments, multidisciplinary approaches, and in international collaboration. Growing investment in biogeochemical sensors and deep autonomous Argo profiling floats are one of the factors driving GOOS evolution. In addition, emerging components of the system like smart cables and Unmanned Surface Vehicles continued to develop, in part due to strong collaboration with private sector partners.

The evolution of the observing system to observe biological and ecological phenomena has been underway for years, and it is now accelerating as GOOS continues to catalyze discussions to monitor change in the ocean ecosystem around 12 Essential Ocean Biological Variables, such as seagrass habitats, and to promote open access to data.

The existing *in situ* and satellite observing system is challenged to effectively track marine heatwaves, and the GOOS community is working to design and develop an ocean observation strategy to improve marine heatwave forecasts and provide actionable data and information to stakeholders. High-quality metocean (above ocean atmospheric) data from ships and autonomous instruments are vital for forecasting extreme events such as tropical cyclones, issuing timely warnings, and ensuring safety at sea. However, further observations are needed globally to improve weather and climate forecasts.

The GOOS international partnership, along with national investments from North Hemisphere countries, need to prioritize expanding basic observing coverage in Indian and Southern Ocean regions. Regular basin-based coordination meetings are improving the system's implementation bridging gaps and collaborating with national academic fleets, regional bodies, and third-parties like shipping industry and ocean racing.

In the face of climate change, the global community must work together to improve the coverage, quality, and multidisciplinary nature of the observing system to meet vital forecasting services and societal needs. OceanOPS can help make these connections.

Mathieu Balbézac, OceanOPS Manager

Ocean Observing System
Report Card 2023
GOOS Observations Coordination
Group (OCG)

NOAA OAR GOMO supports
~40% of GOOS

In a flat funding environment,
it is very hard to maintain, let
alone grow the observing
system

- Most OceanSITES surface moorings are supported by NOAA. Many have joint support from other countries.
- All tropical moored buoys & some extratropical buoys telemeter data to modeling centers in near-realtime.
- Some near-realtime METOC data are used to constrain models. This was original purpose of tropical moorings.
- Data are also used for assessing satellite & model products
- Most of the “Flux” moorings also monitor air-sea CO₂ flux, and surface ocean acidification.
- High resolution, long time series of multiple variables used for analyzing processes governing climate system

NOAA/NWS/NDBC is recapitalizing Tropical Pacific Observing System (TPOS). Will have fewer, but more capable moorings.

Mission

OCS mooring sites (stars) shown on a map of net surface heat flux (W/m^2). Other air-sea flux observatories are indicated by black squares.

The mission of the Ocean Climate Stations Project (OCS) is to make meteorological and oceanic measurements from autonomous platforms. These reference time series and innovative measurements are used to improve satellite products and forecast models, and improve our understanding of air-sea interactions and their role within the climate system.

With more than 70% of the Earth covered by oceans, global weather and climate are strongly affected by exchanges of heat and moisture between the ocean and the air. Improved understanding of the climate system will help society adapt to climate variations and changes. Improved, more physically realistic forecast models will help reduce society's vulnerability to weather and climate extremes, preparing a weather-ready nation.

The OCS program encourages broad use of the data and welcomes collaboration. Visit our data pages, and contact us to learn more.

What's New

Key Climate Observations Restored with Deployment of KEO Buoy

The KEO moored buoy (pink star) was deployed just in time to observe an intense atmospheric river (as shown in the satellite image) that connected the western Pacific to the east and brought stormy weather and heavy precipitation to the Pacific Northwest. Click on image to see full image. Cloud image created from worldview.

May 03, 2022
March 31, 2022:
The Kuroshio Extension Observatory (KEO) moored buoy was successfully deployed by NOAA PMEL and partners, renewing an ongoing OceanSITES time series that began almost 18 years ago. First deployed in 2004, its time series was disrupted by the COVID pandemic. KEO collects vital data in the Kuroshio Extension recirculation gyre, a region known to affect the development of storms over the North Pacific before they reach the United States.

The deployment was just in time for KEO to capture the air-sea interaction process underneath an intense ... more

Instructions

To view plots or download data from the KEO, Papa and ARC moorings: Click a blue site button to select the mooring, and use the menus to define the time period of interest, and sample rate. Choose observations to display by clicking checkboxes. A gray box indicates that data are unavailable. Availability of observations changes as you change the time range and data frequency. Click the purple **Display** button to view plots. To deliver data, choose the file type (ASCII or netCDF) and the compression, and then click the red **Deliver** button. Light blue lines on plots are climatological averages.

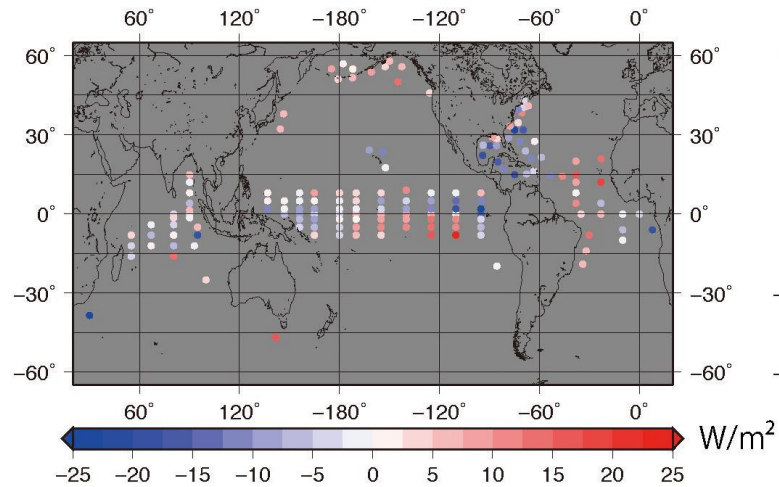

Note: Please do not use your browsers 'Back' button. To clear selections click the orange **Clear** button.

Over 79 peer-reviewed papers since 2020. More than 20 of these use the OCS data to assess biases in Satellite and Model products

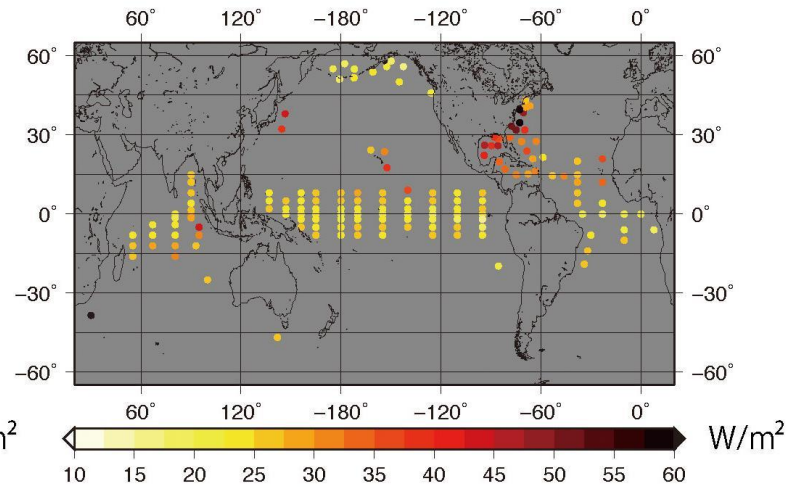

Comparison of J-OFURO3 air-sea heat fluxes versus daily-averaged **buoys** for the period 2002–2013, in units $W\ m^{-2}$

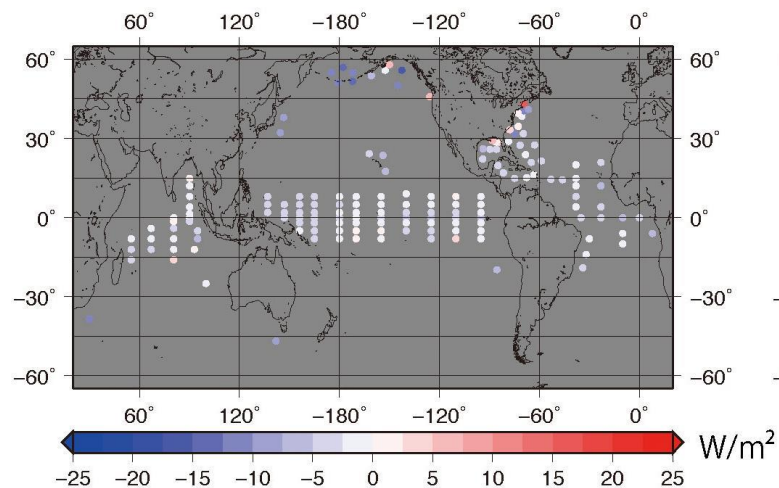

A Q_{lat} bias (latent heat flux)

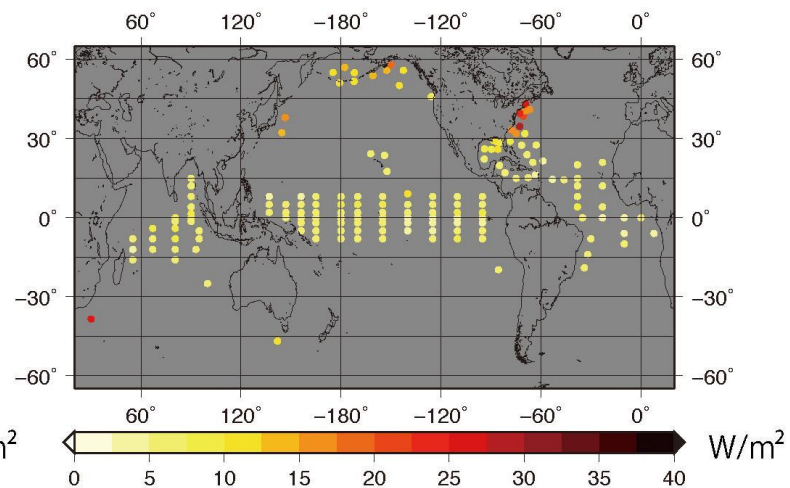

B Q_{lat} RMSE (latent heat flux)

C Q_{sen} bias (sensible heat flux)

D Q_{sen} RMSE (sensible heat flux)

From Cronin et al. (2019), based upon Tomita et al. (2017, Figure 5)

OceanSITES data are used to assess uncertainties in remotely sensed flux Essential Ocean Variables and corresponding error in net surface heat flux (Q_{net}) and wind stress products

Observable	Sensor	Horizontal Temporal Resolution	Sensor accuracy of swath (and contribution to Q_{net} uncertainty)	Uncertainty of gridded product at available daily or monthly resolution (and contribution to Q_{net} uncertainty)	References
Ocean surface wind speed and direction	Scatterometer and Passive Microwave Radiometer	25 km/12 h	0.6–1.6 m s ⁻¹ (13–26 W m ⁻²)	0.6–1.6 m s ⁻¹ (9.6–26 W m ⁻²)	Yu and Jin, 2012; Zhang et al., 2018
Skin SST	Infrared Radiometer; Passive Microwave Radiometer (which measures an approximation to the sub-skin temperature)	1 km/12 h	0.2–0.6 K (9–26 W m ⁻²)	0.2–0.6 K (9–26 W m ⁻²)	Corlett et al., 2014; Gentemann and Hilburn, 2015; Kilpatrick et al., 2015; Tu et al., 2015; Bulgin et al., 2016
Near surface air temp	Technology advancements needed	25 km/12 h	1.3–1.55 K (18–22 W m ⁻²)	0.5–1.55 K (6–22 W m ⁻²)	Jackson and Wick, 2010; Roberts et al., 2010; Yu and Jin, 2018
Near surface specific air humidity	Passive Microwave Radiometer	25 km/12 h	1–1.3 g/kg (20–26 W m ⁻²)	0.8–1 g/kg (16–20 W m ⁻²)	Roberts et al., 2010; Tomita et al., 2018; Yu and Jin, 2018
Surface solar radiation	Imagers (multi-channel), CERES, ancillary	100 km/3 h	55 W m ⁻² (55 W m ⁻²)	11 W m ⁻² (11 W m ⁻²)	Rutan et al., 2015; Kato et al., 2018
Surface longwave radiation	Imagers (multi-channel), CERES, ancillary	100 km/3 h	20 W m ⁻² (20 W m ⁻²)	5 W m ⁻² (5 W m ⁻²)	Rutan et al., 2015; Kato et al., 2018

Accuracy values estimated from comparisons with buoys. Contribution to error in net surface heat flux computed from the tropical database as per **Table 1**. Column 2 (Sensor) describes instrumentation and where technological advances are needed. Column 5 shows daily resolution of gridded fields for all variables except solar and longwave radiation. For these, monthly averaged resolution is shown. Unless otherwise noted, accuracies are total uncertainties, including random uncertainty. Also unless otherwise noted, accuracies are estimated from globally distributed comparisons. As the quoted effect of these uncertainty values on the net heat flux are based on Tropical/sub-Tropical measurements they may not apply at mid-high latitudes. Uncertainties of the gridded products do not include uncertainties due to sampling error, and therefore underestimate the true uncertainty by some unknown percentage.

What Ocean Observations are needed to make transformative change over the next decade?

Air-Sea Fluxes With a Focus on Heat and Momentum

Summary

Air-sea exchanges of energy, moisture, and gases drive and modulate the Earth's weather and climate, influencing life, including our own. Air-sea interactions affect the distribution of carbon dioxide between the atmosphere and ocean, how seawater flows and winds blow, and how pollutants floating on the ocean surface move – information critical to policymakers, industry, and civil society. The Observing Air-Sea Interactions Strategy (OASIS) Programme brings together the vast community of researchers, stakeholders, and experts on air-sea interactions to harmonize observational strategies and develop a practical, integrated approach to observing air-sea interactions through capacity development, and leveraging of multi-disciplinary activities. OASIS will work with partners around the world to build a truly global air-sea interactions observing system that will provide transformative observational-based knowledge to fundamentally improve weather, climate, and ocean predictions, and promote healthy oceans, the blue economy, and sustainable food and energy.

Duration: 01/11/2021 - 31/12/2030

Priority Activities (first 2 years)

OASIS Priority Activities are organized within 5 Theme Teams:

- 1) Observing Network Design & Model Improvements
- 2) Partnership & Capacity Strengthening
- 3) UN Decade of Ocean Science Actions
- 4) Best Practice & Interoperability Experiments
- 5) FAIR Data, Models, & OASIS Products

To join one or more of these Theme Teams, please go to airseaobs.org/get-involved

“Earth is a water world and through the OASIS Programme we will work together to better understand, observe and predict how the ocean and atmosphere interact. OASIS will not only improve forecasts of weather and climate fueled by ocean heat and moisture, but also make it possible to track how much carbon dioxide is absorbed by the ocean.”

Dr. Meghan Cronin, Oceanographer at NOAA and Co-chair of the Scientific Committee on Ocean Research (SCOR) Working Group #162 for developing an OASIS

OASIS Mission & Vision

OASIS Mission is to develop a practical, integrated approach for observing air-sea exchanges associated with the Energy, Water, Carbon and Life Cycles

Recent hybrid OASIS workshop had more than 54 in person participants, with Early Career Ocean Professionals from Africa, South America, Asia, Australia, Europe, and North America

OASIS envisions a pathway to Get Involved in Ocean-Atmosphere Interaction Science for Sustainable Development. www.airseaobs.org/get-involved

To Join Task Teams: airseaobs.org/get-involved

Grand Idea #1: Expanding the in situ observing system – Fill Gaps in GOOS!

- Technology Development Dream Team
- Uncrewed Surface Vehicle Network for the Global Ocean Observing System
 - Webinar Series!

Grand Idea #2: Improve air-sea interaction observing from satellites

- Webinar Series!

Grand Idea #3: Improve hierarchy of Earth System Models for air-sea interactions

- Building international partnerships to expand process study field campaigns

OASIS Theory of Change

- Best Practices and Interoperability Experiments
- Partnership & Capacity Strengthening

Need obs. from New Technologies:

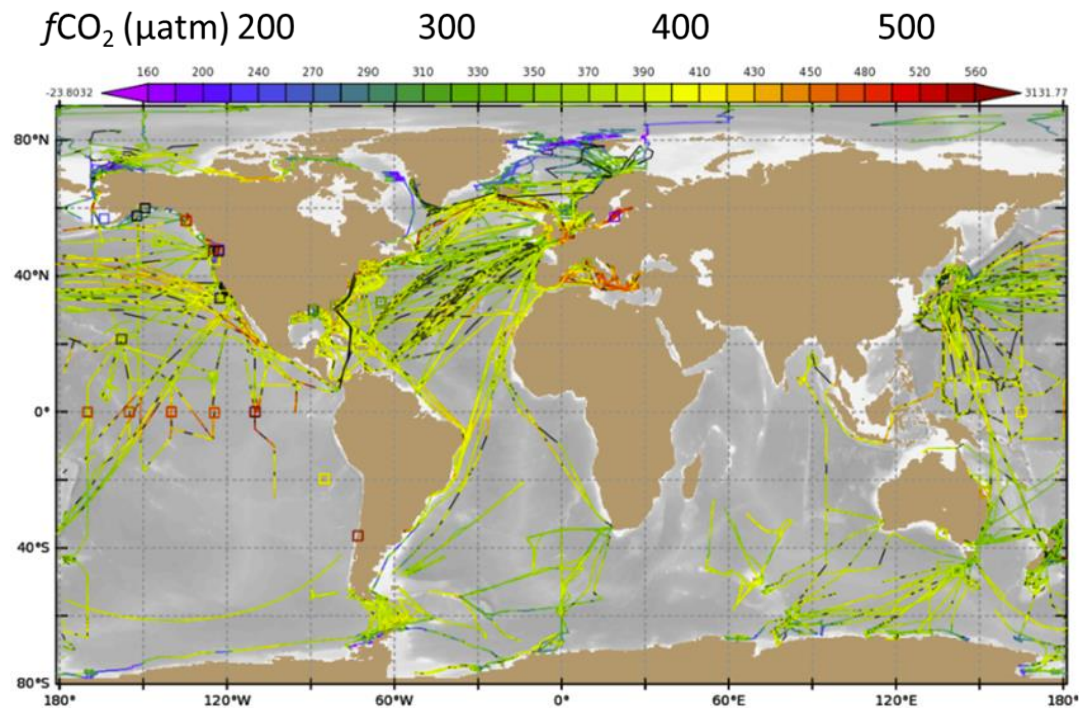

Grand Idea #1: Fill Gaps in GOOS

Need more obs. from Established Platforms:

Surface ocean CO₂ flux (uptake) measurements collected in 2015

Wanninkhof et al. (2019) "A Surface Ocean CO₂ Reference Network, SOCONET and Associated Marine Boundary Layer CO₂ Measurements"

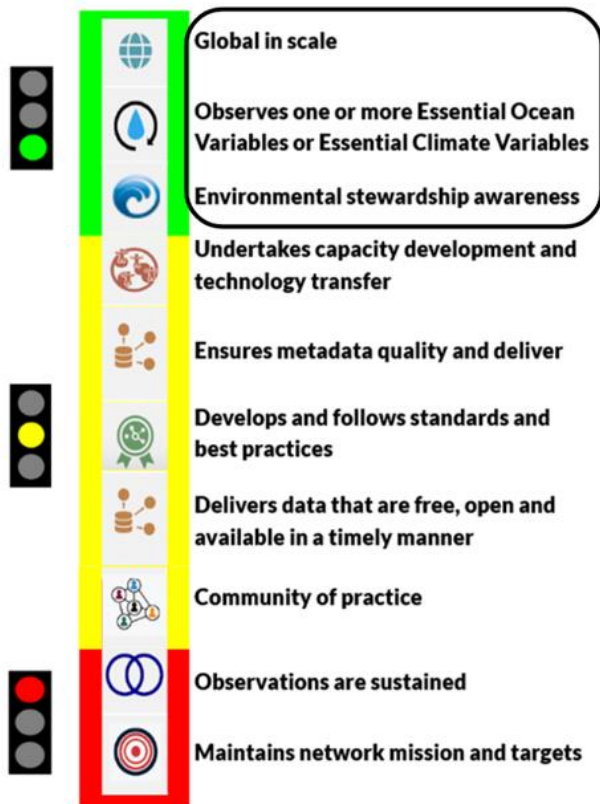

Need obs. from New Technologies:

Grand Idea #1: Fill Gaps in GOOS

An Emerging Uncrewed Surface Vehicle Network

Attribute Report out

Global in scale - Greater than regional, and as far as feasible, intention to be global.

Credit: Saildrone Inc

Joined up with EuroSeas who have been developing network in Europe

Persistent, scalable, diverse, manoeuvrable

Observes one or more EOVs or ECVs - Contributes to meeting requirements through observing one or more of the GOOS Essential Ocean Variables or GCOS¹ Essential Climate Variables.

New capability for observing direct covariance wind stress for Saildrone (Reeves Eyre et al. 2023)

Multidisciplinary AIR and SEA instrument-based observations

Atmosphere	Land	Ocean
Surface <ul style="list-style-type: none"> ✓ Precipitation ✓ Pressure ✓ Radiation budget ✓ Temperature ✓ Water vapour ✓ Wind speed and direction 	Hydrosphere <ul style="list-style-type: none"> • Groundwater • Lakes • River discharges Cryosphere <ul style="list-style-type: none"> • Glaciers • Ice sheets and ice shelves • Permafrost • Snow Biosphere <ul style="list-style-type: none"> • Above-ground biomass • Albedo • Evaporation from land • Fire • Fraction of absorbed photosynthetically active radiation (FAPAR) • Land cover • Land surface temperature • Leaf area index • Soil carbon • Soil moisture 	Physical <ul style="list-style-type: none"> ✓ Ocean surface heat flux ✓ Sea ice ✓ Sea level ✓ Sea state ✓ Sea surface currents ✓ Sea surface salinity ✓ Sea surface temperature ✓ Subsurface currents ✓ Subsurface salinity ✓ Subsurface temperature Biogeochemical <ul style="list-style-type: none"> ✓ Inorganic carbon ✓ Nitrous oxide ✓ Nutrients ✓ Ocean colour ✓ Oxygen ✓ Tracer tracers Biological/ecosystems <ul style="list-style-type: none"> ✓ Marine habitats ✓ Plankton

Environmental stewardship awareness - Actively develops ideas to minimize environmental footprint and contributes positively towards a healthy ocean.

- > Renewable energy sources
- > Non-expendable
- > Flexible and resilient

Intrinsically environmental

Grand Idea #1: Fill Gaps in GOOS

An Emerging Uncrewed Surface Vehicle Network

Attribute Report out

Attribute Report out

Observations are sustained - Sustained over multiple years, beyond time-span of single research or experimental projects, undertaking routine, systematic and essential ocean observations

NOAA Surface Ocean CO₂ Monitoring network
Missions duration ~ 6 months;
Biofouling often the only limiting factor

Currently funded as single missions for research campaigns and pilot studies

Maintains network mission and targets - A role in the GOOS is defined and progress towards targets can be tracked and progress assessed.

Will be developed by proposed Community of Practice

USV network for GOOS that will **FILL GAPS** in space, time, disciplines and complement existing GOOS infrastructure

Grand Idea #1: Fill Gaps in GOOS

An Emerging Uncrewed Surface Vehicle Network

“The endorsed UN Ocean Decade Project’s goal is to build an **Observing Air-Sea Interaction Strategy (OASIS) & Community of Practice** for this emerging **Uncrewed Surface Vehicle (USV) network**”

Emerging Opportunities for Air-Sea Fluxes from Space

Town Hall, Friday, 23 Feb. 2024, 12:45 CT
Ocean Sciences Meeting 2024, Room 217-219

Organized by Sarah Gille (SIO)
Moderated by Meghan Cronin (NOAA PMEL), co-chair of OASIS
Overview of opportunities to optimize satellites for air-sea fluxes
Discussion

*“Continue this discussion at our weekly ‘**OASIS Air-Sea Fluxes from Space**’ webinar on Tuesdays 11 AM EST. Register to get the zoom link at <https://forms.gle/KjHQ7BvjHtJ97TjT6>.*

-- Sarah Gille (Scripps, USA)

May 7, 2024 NASA announced the selection of four proposals for concept studies of missions to benefit humanity through the study of Earth science, including:

The Ocean Dynamics and Surface Exchange with the Atmosphere (ODYSEA)

This satellite would simultaneously measure ocean surface currents and winds to improve our understanding of air-sea interactions and surface current processes that impact weather, climate, marine ecosystems, and human wellbeing. It aims to provide updated ocean wind data in less than three hours and ocean current data in less than six hours.

The proposal is led by Sarah Gille at the University of California in San Diego

Agenda

I. Welcome: Objectives of town hall

- A. OASIS vision – Meghan Cronin, NOAA PMEL
- B. In situ air-sea fluxes (OOI & OceanSITES) – Jim Edson, WHOI

II. Lightning talks

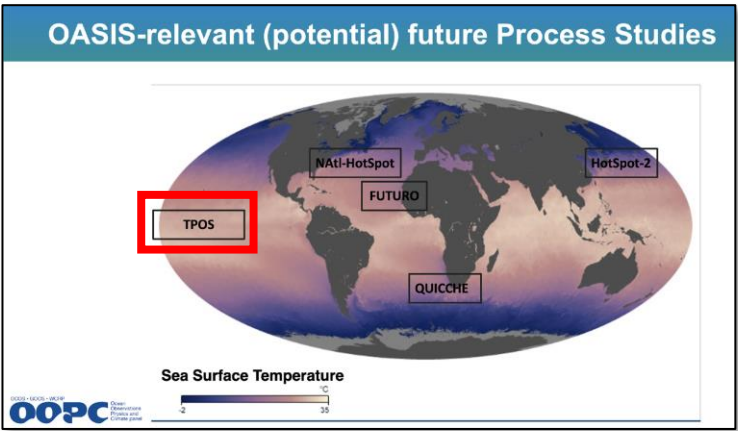

- A. Multiple satellites: Vector winds – Tony Lee, JPL
- B. CIMR: High resolution SST, winds, etc. – Fabrice Collard, Ocean Data Lab
- C. Butterfly: Turbulent buoyancy fluxes (future NASA) – Carol Anne Clayson, WHOI
- D. Harmony: Winds, currents, waves (ESA, launch in ~2029) – Paco Lopez Dekker, TU Delft
- E. SeaSTAR: Coastal & MIZ currents, winds, waves (seeking funding) – Christine Commenginger, NOC

- F. ODYSEA: Winds and currents (under review, NASA/CNES) – Sarah Gille, SIO

III. Discussion: The big picture & community objectives.

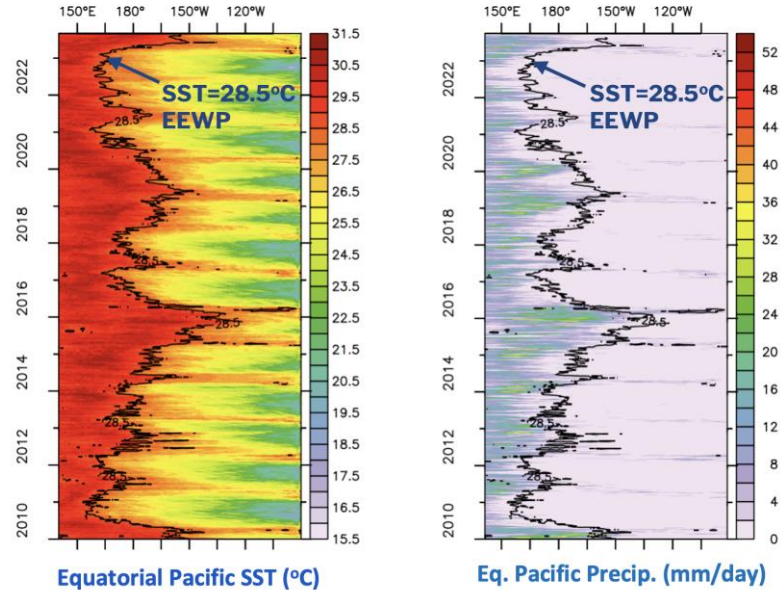

Grand Idea #3: Improve Earth-System Models

TPOS Equatorial Pacific Experiment (TEPEX)

Prediction of ENSO and its world impacts would be improved if we had a better understanding of physics governing:

- Zonal movement of the Eastern Edge of equatorial Pacific Warm Pool
- Equatorial Pacific upwelling & mixing

Current projects build upon previous investments to prepare for a field campaign.

2022	2023	2024	2025	2026	2027
CVP-funded working group	Pre-field Modeling II and Planning			Field Campaign	
Science Community	Lead science plan development, build international collaborations, engage agency program managers, leverage US CLIVAR and other organizing mechanisms, champion and build awareness and support in community				
NOAA Programs	Programs facilitate and coordinate funding, securing observational assets (with labs), coordinate international and interagency engagement and support with community				

Partnerships are vital to the Tropical Pacific Ocean process studies.

What are we working towards together?

Broad community and NOAA support for a science plan that has clear mutual benefits to participating nations

International partner engagement from the scientist to agency level to bring resources and observing assets to the field for research yielding outcomes

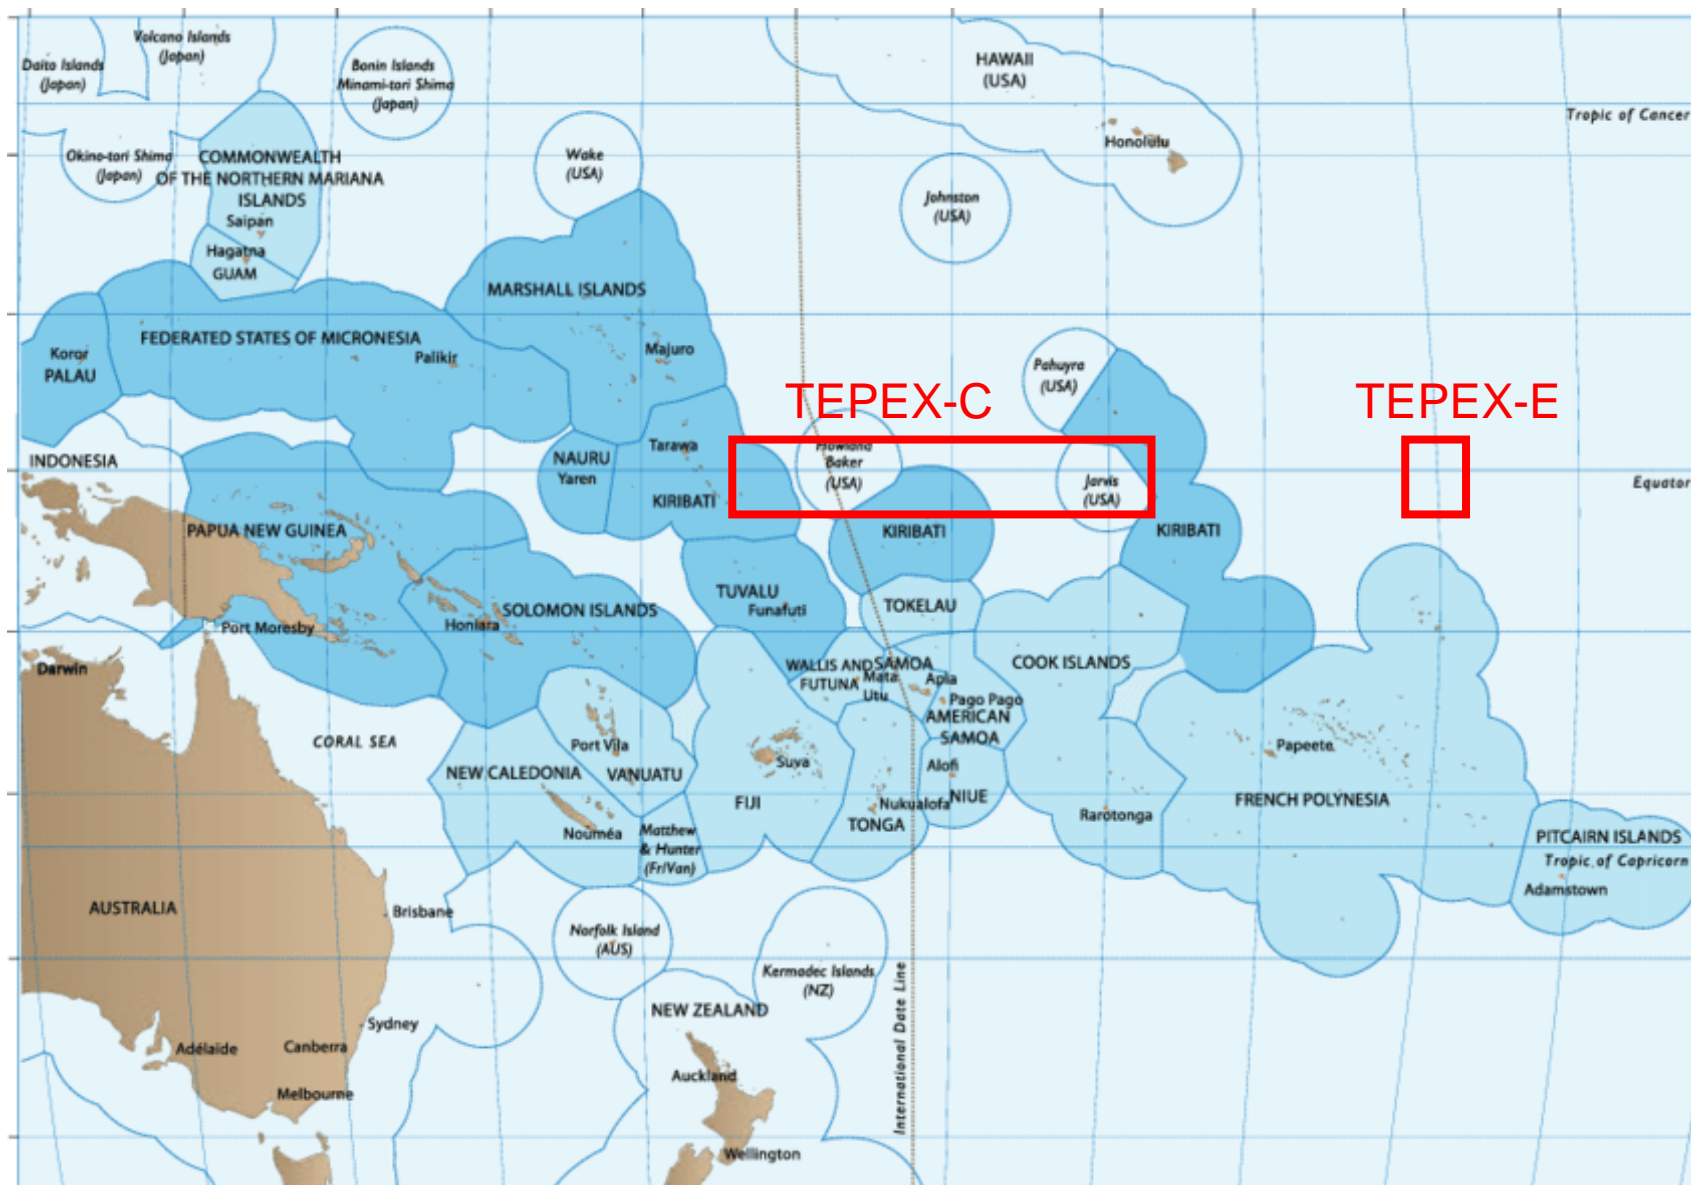

US federal agency awareness and participation in areas relevant to their missions

Saildrones (left) are equipped to measure ocean and weather variables. (NOAA)
