AUTONOMOUS

AERIAL

SYSTEMS OFFICE

Autonomous Aerial Systems Office

Workforce Development: Hands-on experience
for students

About Us

Director: Jeremy Crowley (1.0 FTE)

Assistant Director: Bart Bauer (.75 FTE)

Chief Pilot: Patrick Doyle (.49 FTE)

Anna Moser: Pilot/GIS Analyst (.49 FTE)

Jonathan Cordova: Pilot/GIS Analyst (.49 FTE)

Part of Broader Impacts Group (BIG)

Office of Sponsored Programs

Why does UM have a UAS office?

The Autonomous Aerial Systems Office (AASO) mission is

- Coordinate and guide faculty, staff, and students through the understanding and decision-making process, regarding implementation of UAS in a changing research and regulatory environment
- Establish the infrastructure and resources in order to create sustainable autonomous aerial research
- Stimulate UAS-related innovation, entrepreneurship and workforce development in the state of Montana

AASO Projects - Wildlife

Collaboration with The Nature Conservancy
Matador Ranch to improve sage grouse
population counts

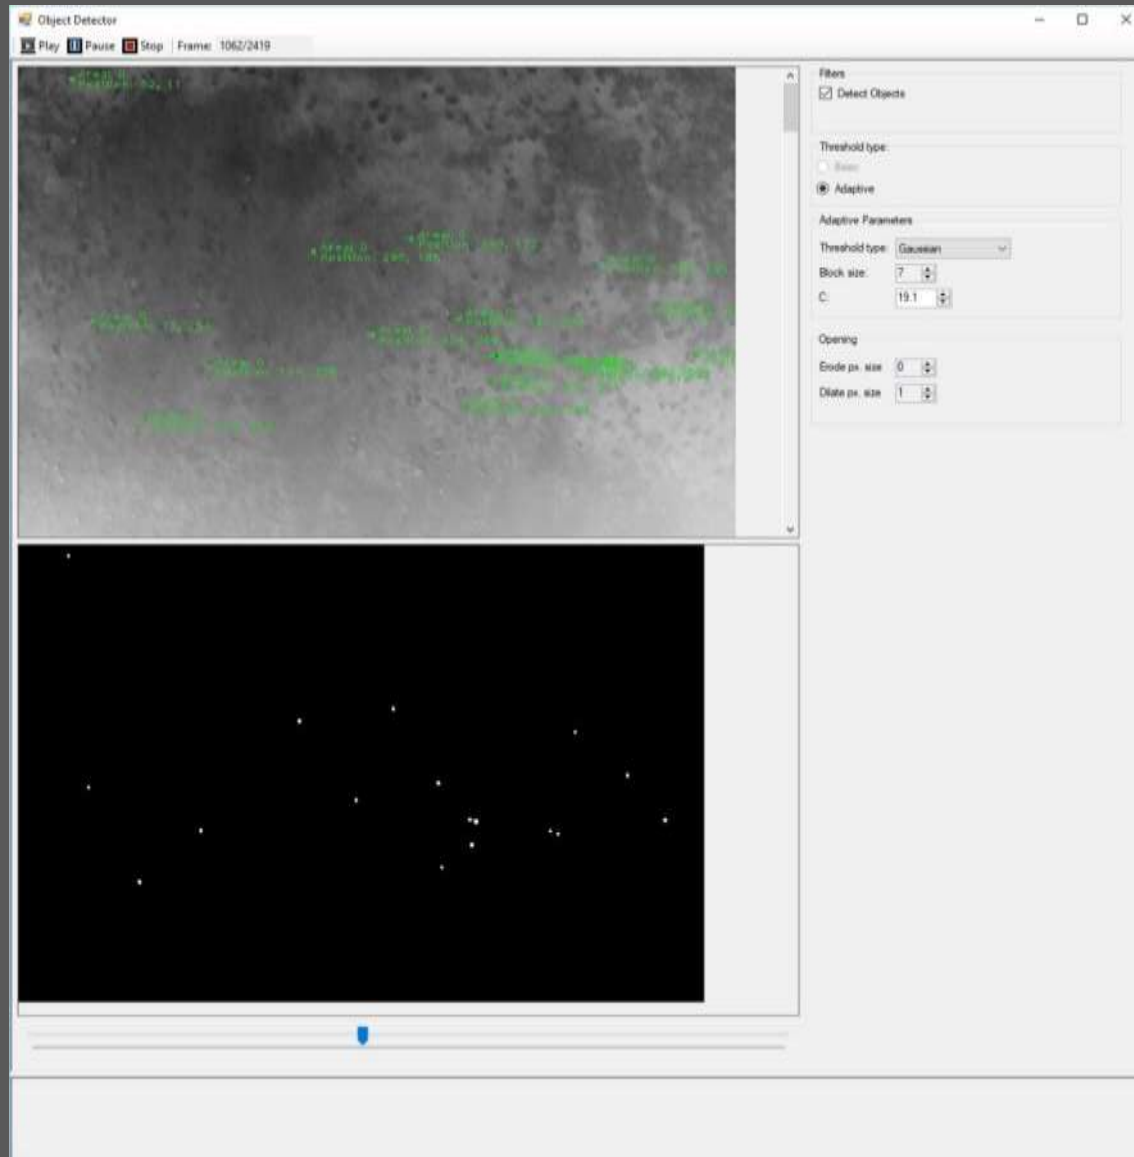

AASO used nighttime IR imagery to detect both males and female sage grouse.

2021 field campaign with sage grouse involves night vision imagery to assist with gender differentiation.

Preliminary work with machine learning algorithms are being done to detect the grouse automatically from the aerial imagery.

IR imagery can also be used for prairie dog town assessment, i.e. growth and collapse of colonies

Development of workflows and algorithms to increase fire management effectiveness.

DRONEFIRE

Roaring Lion Fire, MT 2016

Post burn assessment with UM's Fire Center

Atmospheric Sounding Studies using multiple platforms

This flight went to 9,500 feet (2900 m) MSL in a comparison test with balloon-borne radiosondes.

Multispectral Studies

10 Band multispectral 444-842nm, GSD
8cm/px at 400ft AGL

Agriculture Studies

These images come from a multispectral camera analysis of the effectiveness of different irrigation practices in collaboration with the Montana State Prison.

Centaurea nigra

UAS: Mavic 2 Pro

Images: 703

GSD: 1.48 cm/pixel

Area: 0.25 km²

Classified orthomosaic of knapweed

Leafy Spurge *Euphorbia virgata*

UAS: Mavic 2 Pro

Images: 1053

GSD: 1.50 cm/pixel

Area: 0.3 km²

Classified orthomosaic of Leafy Spurge area of interest

Hyperspectral Studies

This work is to assess the presence of ice on a roadway under a grant with the Montana Department of Transportation.

Classification Projects - Vegetation

Classification

UAS:

Matric 100

Sensor:

RedEdge-M

Study Sites:

10

Images:

17,850

Mapped Acres:

48.7 acres

GTP:

1,200 per site

GSD:

2 cm/pixel

Altitude:

30 meters

Maps Produced:

30

Accuracy Assessment:

96%

Classification Projects - Fire

Data collected from actively piloted aircraft

- EO/RGB
- Short Wave IR
- Mid Wave IR
- AIMMS-20 (weather data)

Classification Projects - Fire

Active Burning (orange)

Intense Heat (red)

Smoldering (yellow)

Burnt (black)

Landslide Monitoring

3D point cloud imagery to define weaknesses in retaining wall. This project led to over \$1 million in funding for infrastructure repair.

Site Assessment

Log Deck, Weeds, Erosion

Volumetric

Log deck assessment

3D Modeling of US Forest Service Historic Structures

These projects help maintain forest service inventory of historic structures and lay the ground work for 3D printing of the models.

MSU-Lighting Evaluation

Future Projects

Assessment of USFS dams and mines structure

Assessment of snow and water resources, fire management and abandoned oil well monitoring. Unreal Engine SfM.

Integrate autonomous terrestrial vehicle with aerial data towards the goal of a vertical, tactical platform stack.
