1630Z 12 Oct

# Some Speed Confluence and Dir Diffidence near FL300

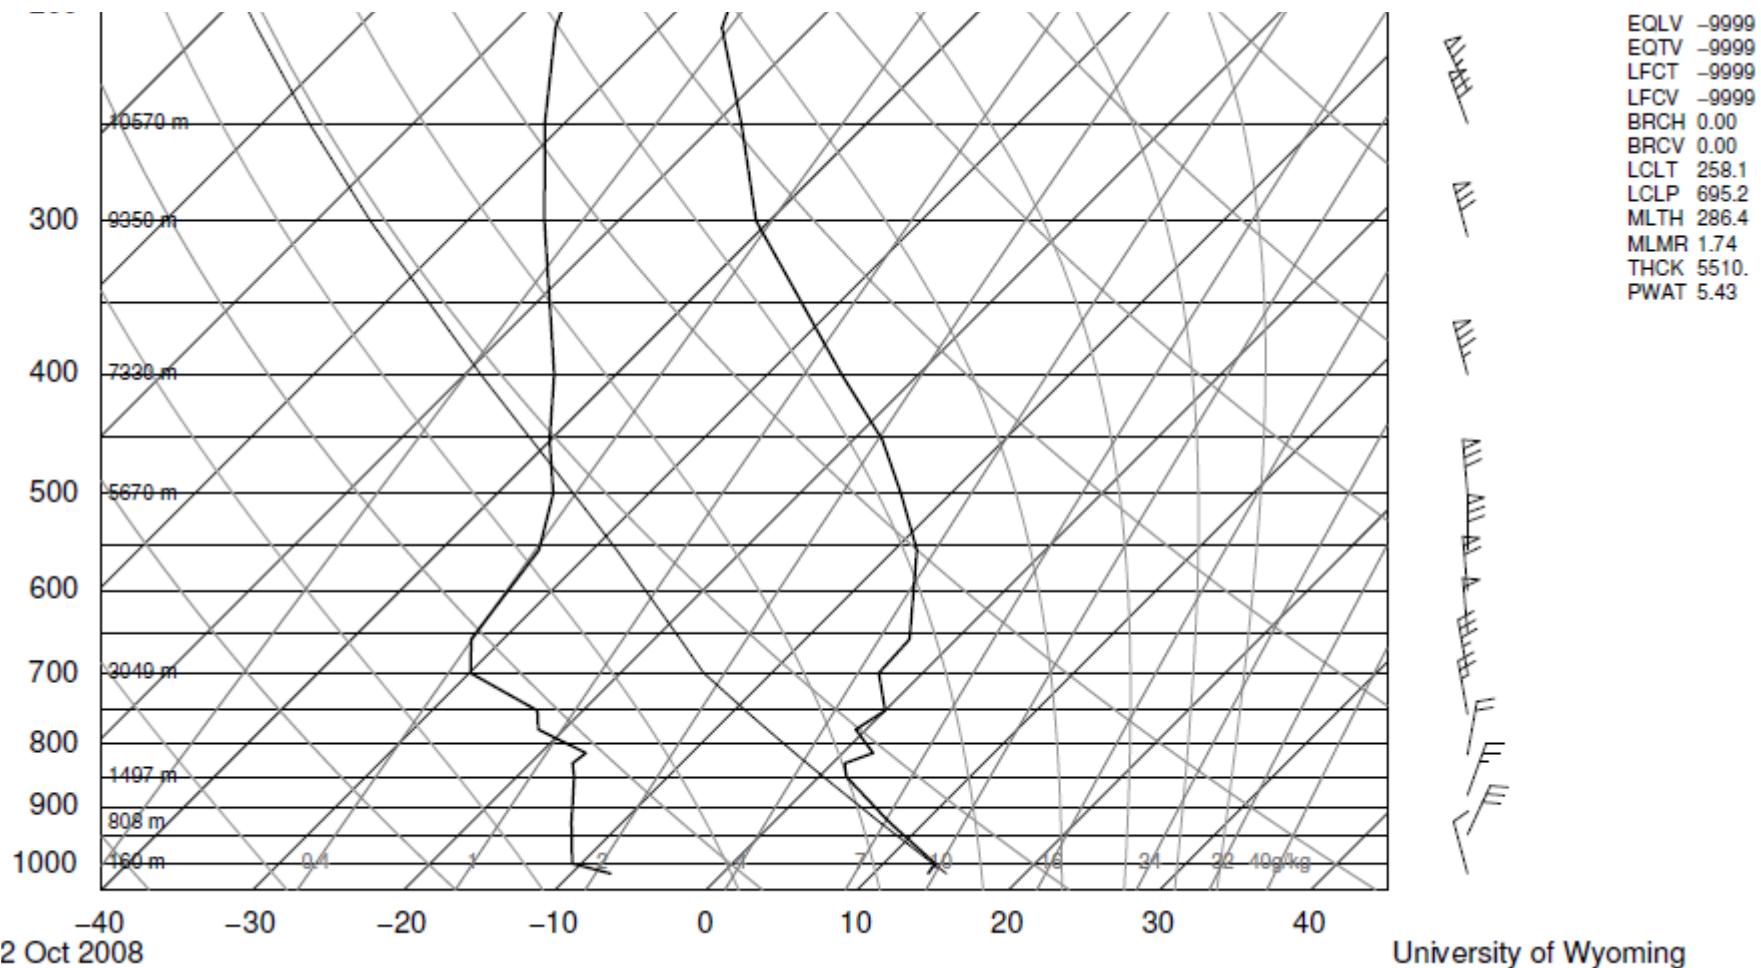

# PIREPS 15Z-18Z 12 Oct

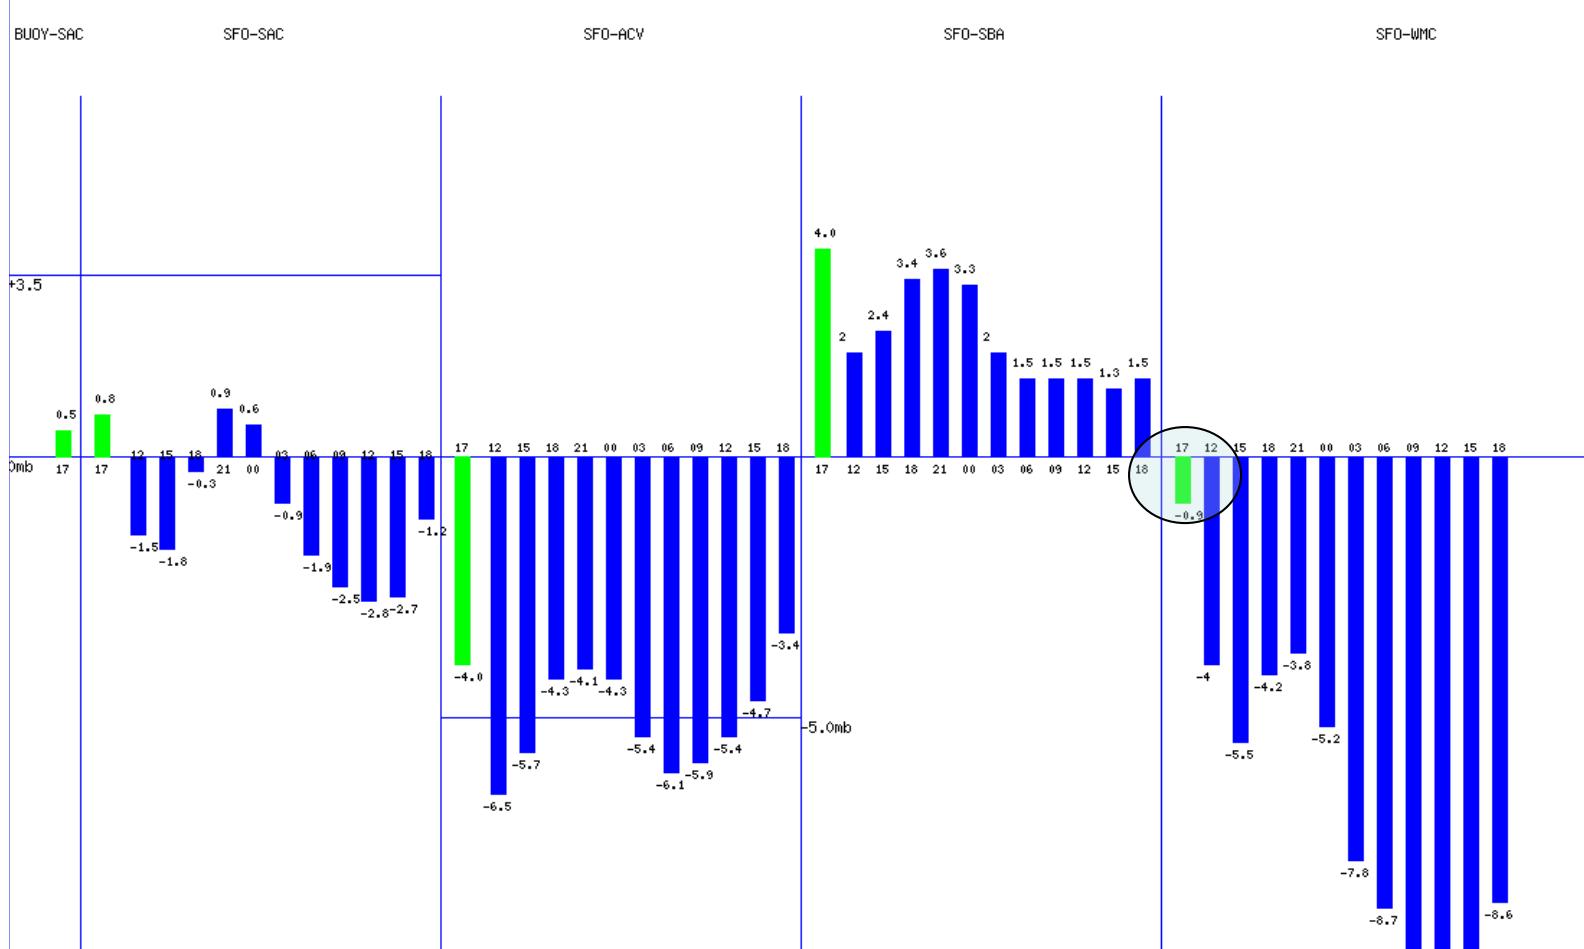

# 12Z Sounding 12 Oct 08

L/L flow not strong enough or ELY enough to cause WDSPR SEV Lo  
Turb over Bay Area hills

# Gradients 17Z 12 Oct

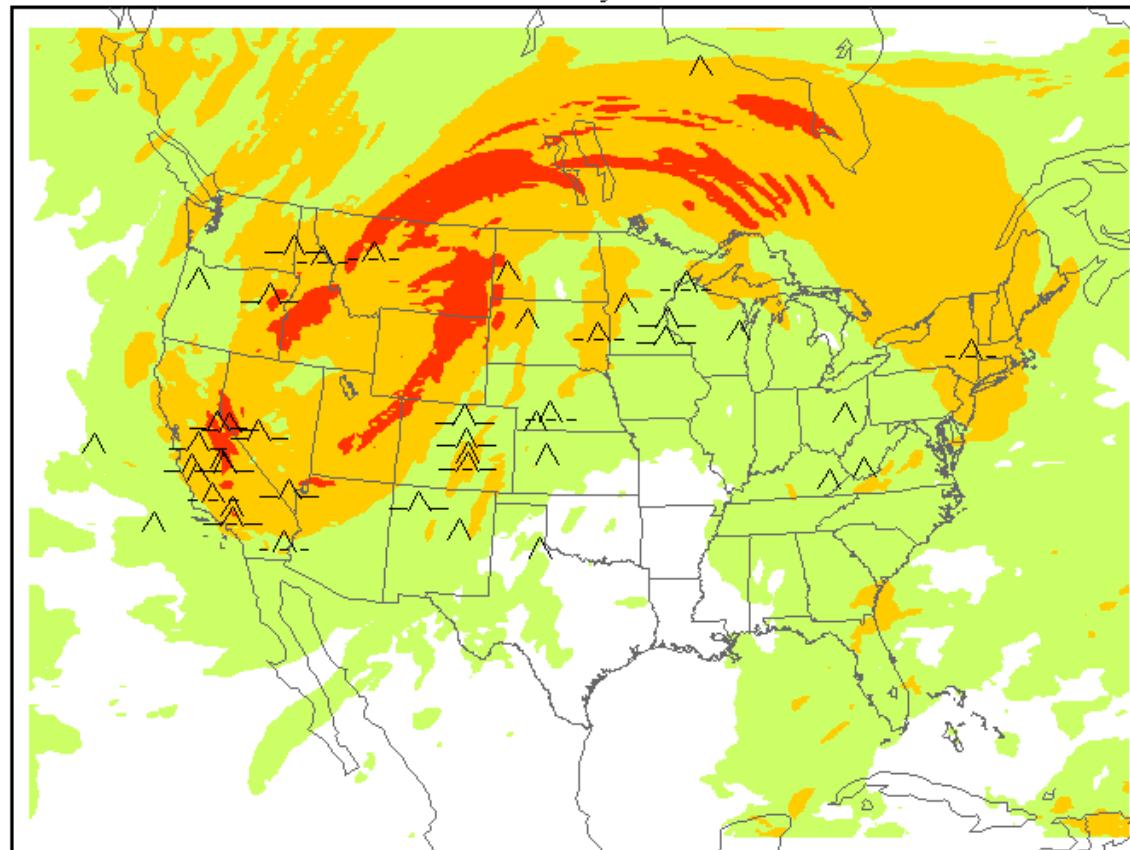

Current ELY SFO-WMC gradient(green -0.9) not strong enough for SEV  
TURB(usually is -10+) and model(blue) overestimating offshore flow

# GTG Model Generally Correct But Overdone

Maximum turbulence potential (FL200-FL450)

Analysis valid 1700 UTC Sun 12 Oct 2008

# Lessons Learned/Notes

- WDSPR Mod Hi Turb Event Several Days After Anomalously Strong Trof Passage
  - Valley Highs Dropped 10F after Trof Psg
  - 24hr H5 Hgt Change 180M 12Z 10/9-10/10
  - 48hr H5 Hgt Change 330M 12Z 10/9-10/11
- No WDSPR Mod-Sev Lo Turb Event
  - SFC Pressure Gradients/Low-Level Flow Not Sufficient Dir(too much parallel to hills) or Speed to Cause Multiple Sev Lo Turb Rptrs(1 Sev Lo Turb LVK)
